TRILL OAM MIB
draft-ietf-trill-oam-mib-04.txt

Status of this Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/1id-abstracts.txt>.

The list of Internet-Draft Shadow Directories can be accessed at <http://www.ietf.org/shadow.html>.

This Internet-Draft will expire on November 08, 2013.

This document is subject to [BCP 78](#) and the IETF Trust's Legal Provisions Relating to IETF Documents (<http://trustee.ietf.org/license-info>) in effect on the date of publication of this document. Please review these documents carefully, as they describe your rights and restrictions with respect to this document. Code Components extracted from this document must include Simplified BSD License text as described in Section 4.e of the Trust Legal Provisions and are provided without warranty as described in the Simplified BSD License.

Abstract

This document specifies the Management Information Base (MIB) for the IETF TRILL (Transparent Interconnection of Lots of Links) OAM objects.

[1.](#) Introduction

Overall, TRILL OAM is intended to meet the requirements given in [\[RFC6905\]](#). The general framework for TRILL OAM is specified in [\[RFC7174\]](#). The details of the Fault Management (FM) solution, conforming to that framework, are presented in [RFC 7455](#). The solution leverages the message format defined in Ethernet Connectivity Fault Management (CFM) [\[802.1Q\]](#) as the basis for the TRILL OAM message channel.

This document uses the CFM MIB modules defined in [[802.1Q](#)] as the basis for TRILL OAM MIB, and augments the existing tables to add new TRILL managed objects required by TRILL. This document further specifies a new table with associated managed objects for TRILL OAM specific capabilities.

2. The Internet-Standard Management Framework

For a detailed overview of the documents that describe the current Internet-Standard Management Framework, please refer to [section 7 of RFC 3410](#) [[RFC3410](#)].

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. MIB objects are generally accessed through the Simple Network Management Protocol (SNMP). Objects in the MIB are defined using the mechanisms defined in the Structure of Management Information (SMI). This memo specifies a MIB module that is compliant to the SMIV2, which is described in STD 58, [RFC 2578](#) [[RFC2578](#)], STD 58, [RFC 2579](#) [[RFC2579](#)] and STD 58, [RFC 2580](#) [[RFC2580](#)].

3. Overview

The TRILL-OAM-MIB module is intended to provide an overall framework for managing TRILL OAM. It leverages the IEEE8021-CFM-MIB and IEEE8021-CFM-V2-MIB modules defined in [[802.1Q](#)], and augments the Maintenance End Point(MEP) and MEP Db entries. It also adds a new table for TRILL OAM specific messages.

4. Conventions

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC-2119](#) [[RFC2119](#)].

Acronyms used in the document include the following:

MTVM - Multi-destination Tree Verification Message [[RFC7455](#)]

MTVR - Multi-destination Tree Verification Reply [[RFC7455](#)]

PTM - Path Trace Message [[RFC7455](#)]

PTR - Path Trace Reply [[RFC7455](#)]

MEP - Maintenance End Point [[RFC7174](#)] [8021Q]

MIP - Maintenance Intermediate Point [[RFC7174](#)] [8021Q]
MP - Maintenance Point [[RFC7174](#)]
CCM - Continuity Check Message [8021Q]
FGL - Fine-Grained Label
LBM - Loopback Message [8021Q]
LBR - Loopback Reply [8021Q]
TRILL - Transparent Interconnection of Lots of Links [[RFC6325](#)]

5. Structure of the MIB module

Objects in this MIB module are arranged into subtrees. Each subtree is organized as a set of related objects. The various subtrees are shown below, supplemented with the required elements of the IEEE8021-CFM-MIB module.

5.1. Textual Conventions

Textual conventions are defined to represent object types relevant to the TRILL OAM MIB.

5.2. TRILL-OAM-MIB relationship to IEEE8021-TC-MIB

In TRILL, traffic labeling can be done using either a 12-bit VLAN or a 24-bit fine grain label [[RFC7172](#)].

IEEE8021-TC-MIB defines IEEE8021ServiceSelectorType with two values:

- 1 representing a vlanId, and
- 2 representing a 24 bit isid.

We have chosen to use value 2 for TRILL's fine grain label. As such, TRILL-OAM-MIB will import IEEE8021ServiceSelectorType, IEEE8021ServiceSelectorValueOrNone, and IEEE8021ServiceSelectorValue from IEEE8021-TC-MIB.

5.3. TRILL OAM MIB Tree

TRILL-OAM MIB Tree describe below consists of trilloamNotifications (Traps) and trilloamMibObjects. trilloamNotifications are sent to management entity whenever a MEP loses/restores contact with its peer Flow MEPs.

The TRILL OAM MIB Per MEP Objects are defined in the trilloamMepTable. The trilloamMepTable augments the dot1agCfmMepEntry (please see [section 6.1](#)) defined in IEEE8021-CFM-MIB. It includes objects that are locally defined for an individual MEP and its associated Flow.

TRILL-OAM-MIB

```
|--trilloamNotifications
    |--trilloamFaultAlarm
|--trilloamMibObjects
    |--trilloamMep
        |--trilloamMepTable
        |--trilloamMepFlowCfgTable
        |--trilloamPtrTable
        |--trilloamMtvrTable
        |--trilloamMepDbTable
```

5.3.1. TRILL OAM MIB Notifications

Notifications (fault alarm) are sent to the management entity with the OID of the MEP that has detected the fault. Notifications are generated whenever MEP loses/restores contact with its peer Flow MEPs.

5.3.2. TRILL OAM MIB Per MEP Objects

The TRILL OAM MIB Per MEP Objects are defined in the trilloamMepTable. The trilloamMepTable augments the dot1agCfmMepEntry (please see [section 6.1](#)) defined in IEEE8021-CFM-MIB. It includes objects that are locally defined for an individual MEP and its associated Flow.

5.3.2.1. trilloamMepTable Objects

This table is an extension of the dot1agCfmMepTable and rows are automatically added or deleted from this table based upon row creation and destruction of the dot1agCfmMepTable.

This table represents the local MEP TRILL OAM configuration table. The primary purpose of this table is provide local parameters for the TRILL OAM function found in [RFC 7455](#) and instantiated at a MEP.

5.3.2.2. trilloamMepFlowCfgTable Objects

Each row in this table represents a Flow Configuration Entry for the associated MEP. The table uses four indices. The first three indices are the indices of the Maintenance Domain, MaNet, and MEP tables. The fourth index is the specific Flow Configuration Entry on the selected MEP. Some write-able objects in this table are only applicable in certain cases (as described under each object below), and attempts to write values for them in other cases will be ignored.

5.3.2.3. trilloamPtrTable Objects

Each row in the table represents a Path Trace Reply Entry for the defined MEP and Transaction. This table uses four indices. The first three indices identify the MEP and the fourth index specifies the Transaction Identifier, and this transaction identifier uniquely identifies the response for a MEP which can have multiple flow.

5.3.2.4. trilloamMtvrTable Objects

This table includes Multi-destination Reply managed objects. Each row in the table represents a Multi-destination Reply Entry for the defined MEP and Transaction. This table uses five indices: The first three indices are the indices of the Maintenance Domain, MaNet, and MEP tables. The fourth index is the specific Transaction Identifier on the selected MEP. The fifth index is the receive order of Multi-destination replies. Some write-able objects in this table are only applicable in certain cases (as described under each object below), and attempts to write a value for them in other cases will be ignored.

5.3.2.4. trilloamMepDbTable Objects

This table is an augmentation of the dot1agCfmMepDbTable, and rows are automatically added or deleted from this table based upon row creation and destruction of the dot1agCfmMepDbTable.

6. Relationship to other MIB module

The IEEE8021-CFM-MIB, and LLDP-MIB contain objects relevant to TRILL OAM MIB. Management objects contained in these modules are not duplicated here, to reduce overlap to the extent possible. From IEEE8021-CFM-MIB following objects are imported

- o dot1agCfmMdIndex
- o dot1agCfmMaIndex
- o dot1agCfmMepIdentifier
- o dot1agCfmMepEntry
- o dot1agCfmMepDbEntry
- o Dot1agCfmIngressActionFieldValue
- o Dot1agCfmEgressActionFieldValue
- o Dot1agCfmRemoteMepState

From LLDP-MIB following objects are imported

- o LldpChassisId
- o LldpChassisIdSubtype
- o LldpPortId

6.1. Relationship to IEEE8021-CFM-MIB

trilloamMepTable Augments dot1agCfmMepEntry. Implementation of IEEE8021-CFM-MIB is required as we are Augmenting the IEEE-CFM-MIB Table. Objects/Tables that are not applicable to a TRILL implementation have to be handled by the TRILL implementation back end and appropriate default values as described in IEEE8021-CFM-MIB have to be returned.

TRILL Implementation doesn't support Link Trace Message and Link Trace Reply and statistics with respect of these message should be default as per IEEE8021-CFM-MIB.

6.2. MIB modules required for IMPORTS

The following MIB module IMPORTS objects from SNMPv2-SMI [[RFC2578](#)], SNMPv2-TC [[RFC2579](#)], SNMPv2-CONF [[RFC2580](#)], IEEE-8021-CFM-MIB, LLDP-MIB.

7. Definition of the TRILL OAM MIB module

DESCRIPTION

"This MIB module contains the management objects for the management of Trill Services Operations, Administration and Maintenance.

Initial version. Published as RFC xxxx.

Reference Overview

A number of base documents have been used to create the Textual Conventions MIB. The following are the abbreviations for the baseline documents:

[CFM] refers to 'Connectivity Fault Management', IEEE 802.1ag-2007, December 2007

[Q.840.1] refers to 'ITU-T Requirements and analysis for NMS-EMS management interface of Ethernet over Transport and Metro Ethernet Network (EoT/MEN)', March 2007

[Y.1731] refers to ITU-T Y.1731 'OAM functions and mechanisms for Ethernet based networks', February 2011

Abbreviations Used

Term	Definition
CCM	Continuity Check Message
CFM	Connectivity Fault Management
CoS	Class of Service
IEEE	Institute of Electrical and Electronics Engineers
IETF	Internet Engineering Task Force
ITU-T	International Telecommunication Union - Telecommunication Standardization Bureau
MAC	Media Access Control
MA	Maintenance Association (equivalent to a MEG)
MD	Maintenance Domain (equivalent to a OAM Domain in MEF 17)
MD Level	Maintenance Domain Level (equivalent to a MEG level)
ME	Maintenance Entity
MEG	Maintenance Entity Group (equivalent to a MA)
MEG Level	Maintenance Entity Group Level (equivalent to MD Level)
MEP	Maintenance Association End Point or MEG End Point

MIB Management Information Base
MIP Maintenance Domain Intermediate Point or
MEG Intermediate Point
MP Maintenance Point. One of either a MEP or a MIP
OAM Operations, Administration, and Maintenance
On-Demand OAM actions that are initiated via
manual intervention for a limited time to carry
out diagnostics. On-Demand OAM can result in
singular or periodic OAM actions during the
diagnostic time interval
PDU Protocol Data Unit
RFC Request for Comment
SNMP Simple Network Management Protocol
SNMP Agent An SNMP entity containing one or more command
responder
and/or notification originator applications (along with
their associated SNMP engine). Typically implemented in
an NE.
SNMP Manager An SNMP entity containing one or more command
generator and/or notification receiver applications (
along with their associated SNMP engine). Typically
implemented in an EMS or NMS.
TLV Type Length Value, a method of encoding Objects
UTC Coordinated Universal Time
UNI User-to-Network Interface
VLAN Virtual LAN
PTR Path Trace Reply
PTM Path Trace Message
MTVR Multi-destination Tree Verification Reply
MTVM Multi-destination Tree Verification Message"

OBJECTS { trilloamMepDbFlowState }

STATUS current

DESCRIPTION

"A MEP Flow has a persistent defect condition.

A notification (fault alarm) is sent to the management entity with the OID of the Flow that has detected the fault.

The management entity receiving the notification can identify the system from the network source address of the notification, and can identify the Flow reporting the defect by the indices in the OID of the trilloamMepFlowIndex, and trilloamFlowDefect variable in the notification:

dot1agCfmMdIndex - Also the index of the MEP's Maintenance Domain table entry (dot1agCfmMdTable).

dot1agCfmMaIndex - Also an index (with the MD table index) of the MEP's Maintenance Association network table entry (dot1agCfmMaNetTable), and (with the MD table index and component ID) of the MEP's MA component table entry (dot1agCfmMaCompTable).

dot1agCfmMepIdentifier - MEP Identifier and final index into the MEP table (dot1agCfmMepTable).

trilloamMepFlowCfgIndex - Index identifies indicates the specific Flow for the MEP"

8. Security Considerations

This MIB relates to a system that will provide network connectivity and packet forwarding services. As such, improper manipulation of the objects represented by this MIB may result in denial of service to a large number of end-users.

There are number of management objects defined in this MIB module with a MAX-ACCESS clause of read-create. Such objects may be

considered sensitive or vulnerable in some network environments. The support for SET operations in a non-secure environment without proper protection can have negative effect on sensitivity/vulnerability are described below.

Some of the readable objects in this MIB module (objects with a MAC-ACCESS other than not-accessible) may be considered sensitive or vulnerable in some network environments. It is thus important to control GET and/or NOTIFY access to these objects and possibly to encrypt the values of these objects when sending them over the network via SNMP.

SNMP version prior to SNMPv3 did not include adequate security. Even if the network itself is secure, there is no control as to who on the secure network is allowed to access and GET/SET (read/change/create/delete) the objects in this MIB module.

It is RECOMMENDED that implementers consider the security features as provided by the SNMPv3 framework (see [\[RFC3410\], section 8](#)), including full support for the SNMPv3 cryptographic mechanism (for authentication and privacy).

Further, deployment of SNMP version prior to SNMPv3 is NOT RECOMMENDED. Instead, deployment of SNMPv3 with cryptographic security enabled is RECOMMENDED. It is then a customer/operator responsibility to ensure that the SNMP entity giving access to an instance of this MIB module is properly configured to give only those principals (users) that have legitimate rights to indeed GET or SET (change/create/delete) them access to the objects.

9. IANA Considerations

The MIB module in this document uses the following IANA-assigned OBJECT IDENTIFIER value recorded in the SMI Numbers registry:

```
Descriptor   OBJECT   IDENTIFIER  value
-----
trillOamMIB { mib-2 xxx }
```

Editor's Note (to be removed prior to publication): the IANA is requested to assign a value for "xxx" under the 'mib-2' subtree and to record the assignment in the SMI Numbers registry. When the assignment has been made, the RFC Editor is asked to replace "XXX" (here and in the MIB module) with the assigned value and to remove this note.
