YANG Data Model for TRILL Operations, Administration,
and Maintenance (OAM)

[draft-ietf-trill-yang-oam-05.txt](#)

Status of this Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/lid-abstracts.txt>.

The list of Internet-Draft Shadow Directories can be accessed at <http://www.ietf.org/shadow.html>.

This Internet-Draft will expire on May 04, 2016.

[1.](#) Introduction

Fault Management for TRILL is defined in [TRILLOAMFM]. TRILL Fault Management utilizes the [8021Q] CFM model and extends CFM with technology specific details. Those technology specific extensions are flow-entropy for multipath support, MEP addressing on TRILL identifiers, and so on. The extensions are explained in detail in [TRILLOAMFM]. In this document, we extend the YANG model defined in [GENYANGOAM] with TRILL OAM specifics.

- [2.](#) Conventions used in this document The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be

interpreted as described in [RFC-2119](#) [[RFC2119](#)]. In this document, these words will appear with that interpretation only when in ALL CAPS. Lower case uses of these words are not to be interpreted as carrying [RFC-2119](#) significance.

2.1. Terminology

CCM - Continuity Check Message [[8021Q](#)]
 ECMP - Equal Cost Multipath
 LBM - Loopback Message [[8021Q](#)]
 MP - Maintenance Point [[8021Q](#)]
 MEP - Maintenance End Point [[RFC7174](#)] [[8021Q](#)] [[RFC6371](#)]

TRILL OAM YANG

March 31, 2017

MIP - Maintenance Intermediate Point [[RFC7174](#)] [[8021Q](#)] [[RFC6371](#)]
 MA - Maintenance Association [[8021Q](#)] [[RFC7174](#)]
 MD - Maintenance Domain [[8021Q](#)]
 MTV - Multi-destination Tree Verification Message
 OAM - Operations, Administration, and Maintenance [[RFC6291](#)]
 TRILL - Transparent Interconnection of Lots of Links [[RFC6325](#)]

3. Architecture of OAM YANG Model and Relationship to TRILL OAM

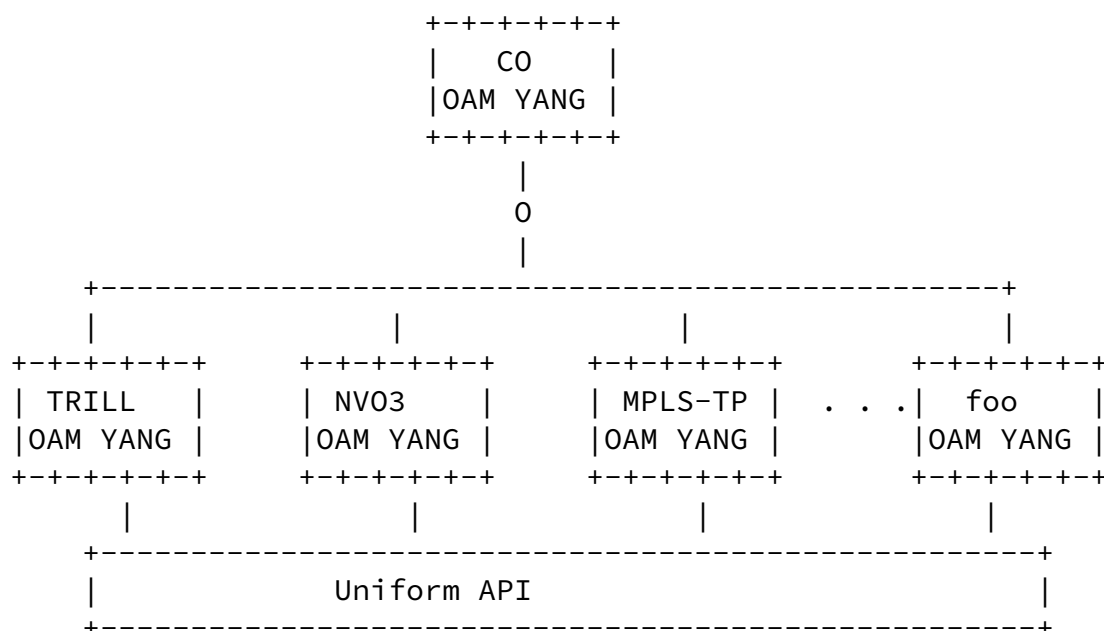

Figure 1 Relationship of TRILL OAM YANG model to
Generic Connection Oriented OAM YANG model

[4.](#) TRILL extensions to Generic YANG Model

The Technology parameter is defined in the [\[GENYANGOAM\]](#) as an identity. This allows easy extension of the YANG model by other technologies. Technology-specific extensions are applied only when the Technology parameter is set to the specific type. "trill" is defined as an identity that augments the base "technology-types".

```
identity trill {      base goam:technology-types;      description
"trill type"; }
```

Figure 2 Trill identity type.

[4.1](#) MEP Address

In TRILL, the MEP address is the 2 octet RBridge Nickname. In [\[GENYANGOAM\]](#) MEP address is defined as a combination choice and case statement. We augment this to include TRILL RBridge nickname. augment
"/goam:domains/goam:domain/goam:MA/goam:MA/goam:MEP/goam:mep-address" {
 case mep-address-trill {
 leaf mep-address-trill {
 when "/goam:domains/goam:domain/goam:technology='trill'";
 type trill-rb-nickname;
 }
 }
}

Figure 3 Augment MEP address

[4.2](#) Flow Entropy

In TRILL, flow-entropy is defined as a 96 octet field. [\[GENYANGOAM\]](#) defines a placeholder for flow-entropy. This allows other technologies to easily augment that to include technology-specific augmentations. Below figure depicts an example of augmenting flow-entropy to include TRILL flow-entropy. augment
"/goam:domains/goam:domain/goam:MA/goam:MA/goam:flow-entropy" {
 case flow-entropy-trill {
 leaf flow-entropy-trill {
 type

```
flow-entropy-trill;    }    }    }
```

Figure 4 TRILL flow-entropy

4.3 Context-id

In TRILL, context-id is either 12 bit VLAN identifier or 24 bit fine-grained label. [GENYANGOAM] defines a placeholder for context-id. This allows other technologies to easily augment that to include technology specific extensions. The snippet below depicts an example of augmenting context-id to include the TRILL context-id.

```
augment
"/goam:domains/goam:domain/goam:MA/goam:MA/goam:MEP/goam:context-id"
{
  case context-id-vlan {
    leaf context-id-vlan {
      type
vlan;    }    }
  case context-id-fgl {
    leaf context-id-fgl {
      type fgl;    }    }
}
```

Figure 5 TRILL context-id

4.5 RPC definition

The rpc model facilitates issuing commands to a NETCONF server (in this case to the device that needs to execute the OAM command) and obtaining a response. Grouping statement command-ext-trill defines the input extensions for TRILL.

Continuity-check (CCM)[RFC7455], continuity-verification (LBM/LBR)[RFC7455], and traceroute (PTM/PTR)[RFC7455] are defined in Generic Lime Model[GENYANGOAM].

Multicast Tree Verification (MTV) [RFC7455] rpc command, defined in TRILL YANG model, is TRILL specific and allows to verify connectivity as well as data-plane and control-plane integrity of TRILL multicast forwarding.

5. OAM data hierarchy

The complete data hierarchy related to the OAM YANG model is presented below. The following notations are used within the data tree and carry the meaning as noted below. Each node is printed as: <status> <flags> <name> <opts> <type>

<status> is one of: + for current x for deprecated o
for obsolete

<flags> is one of: rw for configuration data ro for non-
configuration data -x for rpcs -n for notifications

<name> is the name of the node

If the node is augmented into the tree from another module, its
name is printed as <prefix>:<name>.

<opts> is one of: ? for an optional leaf or choice ! for a
presence container * for a leaf-list or list [<keys>] for a
list's keys

<type> is the name of the type for leafs and leaf-lists

11. Acknowledgments

Giles Heron came up with the idea of developing a YANG model as a way of creating a unified OAM API set (interface), work in this document is largely an inspiration of that. Alexander Clemm provided many valuable tips, comments and remarks that helped to refine the YANG model presented in this document.
