TinyMT32 Pseudo Random Number Generator (PRNG)
draft-ietf-tsvwg-tinymt32-05

Abstract

This document describes the TinyMT32 Pseudo Random Number Generator (PRNG) that produces 32-bit pseudo-random unsigned integers and aims at having a simple-to-use and deterministic solution. This PRNG is a small-sized variant of Mersenne Twister (MT) PRNG. The main advantage of TinyMT32 over MT is the use of a small internal state, compatible with most target platforms that include embedded devices, while keeping a reasonably good randomness that represents a significant improvement compared to the Park-Miller Linear Congruential PRNG. However, neither the TinyMT nor MT PRNG are meant to be used for cryptographic applications.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on December 19, 2019.

[1.](#) Introduction

This document specifies the TinyMT32 PRNG, as a specialization of the reference implementation version 1.1 (2015/04/24) by Mutsuo Saito and Makoto Matsumoto, from Hiroshima University, that can be found at [\[TinyMT-web\]](#) (TinyMT web site) and [\[TinyMT-dev\]](#) (Github site). This specialisation aims at having a simple-to-use and deterministic PRNG, as explained below. However, the TinyMT32 PRNG is not meant to be used for cryptographic applications.

TinyMT is a new small-sized variant introduced in 2011 of the Mersenne Twister (MT) PRNG [\[MT98\]](#). This document focusses on the TinyMT32 variant (rather than TinyMT64) of the TinyMT PRNG, which outputs 32-bit unsigned integers.

The purpose of TinyMT is not to replace Mersenne Twister: TinyMT has

a far shorter period ($2^{127} - 1$) than MT. The merit of TinyMT is in the small size of the internal state of 127 bits, far smaller than the 19937 bits of MT. The outputs of TinyMT satisfy several statistical tests for non-cryptographic randomness, including BigCrush in TestU01 [[TestU01](#)] and AdaptiveCrush [[AdaptiveCrush](#)],

leaving it well-placed for non-cryptographic usage, especially given the small size of its internal state (see [[TinyMT-web](#)]). From this point of view, TinyMT32 represents a major improvement with respect to the Park-Miller Linear Congruential PRNG (e.g., as specified in [[RFC5170](#)]) that suffers several known limitations (see for instance [[PTVF92](#)], section 7.1, p. 279, and [[RLC-ID](#)], [Appendix B](#)).

The TinyMT32 PRNG initialization depends, among other things, on a parameter set, namely (mat1, mat2, tmat). In order to facilitate the use of this PRNG and make the sequence of pseudo-random numbers depend only on the seed value, this specification requires the use of a specific parameter set (see [Section 3.1](#)). This is a major difference with respect to the implementation version 1.1 (2015/04/24) that leaves this parameter set unspecified.

Finally, the determinism of this PRNG, for a given seed, has been carefully checked (see [Section 3.3](#)). It means that the same sequence of pseudo-random numbers should be generated, no matter the target execution platform and compiler, for a given initial seed value. This determinism can be a key requirement as it the case with [[RLC-ID](#)] that normatively depends on this specification.

[2.](#) Definitions

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [BCP 14](#) [[RFC2119](#)] [[RFC8174](#)] when, and only when, they appear in all capitals, as shown here.

[3.](#) TinyMT32 PRNG Specification

[3.1.](#) TinyMT32 Source Code

The TinyMT32 PRNG requires to be initialized with a parameter set that needs to be well chosen. In this specification, for the sake of

simplicity, the following parameter set MUST be used:

- o mat1 = 0x8f7011ee = 2406486510
- o mat2 = 0xfc78ff1f = 4235788063
- o tmat = 0x3793fdff = 932445695

This parameter set is the first entry of the precalculated parameter sets in file `tinymt32dc/tinymt32dc.0.1048576.txt`, by Kenji Rikitake, and available at [[TinyMT-params](#)]. This is also the parameter set used in [[KR12](#)].

The TinyMT32 PRNG reference implementation is reproduced in Figure 1. This is a C language implementation, written for C99 [[C99](#)]. This reference implementation differs from the original source code as follows:

- o the original copyright and license have been removed by the original authors who are now authors of this document, in accordance with [BCP 78](#) and the IETF Trust's Legal Provisions Relating to IETF Documents (<http://trustee.ietf.org/license-info>);
- o the source code initially spread over the `tinymt32.h` and `tinymt32.c` files has been merged;
- o the unused parts of the original source code have been removed. This is the case of the `tinymt32_init_by_array()` alternative initialisation function. This is also the case of the `period_certification()` function after having checked it is not required with the chosen parameter set;
- o the unused constants `TINYMT32_MEXP` and `TINYMT32_MUL` have been removed;
- o the appropriate parameter set has been added to the initialization function;
- o the function order has been changed;
- o certain internal variables have been renamed for compactness purposes;
- o the `const` qualifier has been added to the constant definitions;
- o the code that was dependant on the representation of negative integers by 2's complements has been replaced by a more portable version;

<CODE ENDS>

```

Figure 1: TinyMT32 Reference Implementation

[3.2.](#) TinyMT32 Usage

This PRNG MUST first be initialized with the following function:

```
void tinymt32_init (tinymt32_t* s, uint32_t seed);
```

It takes as input a 32-bit unsigned integer used as a seed (note that value 0 is permitted by TinyMT32). This function also takes as input

a pointer to an instance of a tinymt32_t structure that needs to be

allocated by the caller but left uninitialized. This structure will then be updated by the various TinyMT32 functions in order to keep the internal state of the PRNG. The use of this structure admits several instances of this PRNG to be used in parallel, each of them having its own instance of the structure.

Then, each time a new 32-bit pseudo-random unsigned integer between 0 and $2^{32} - 1$ inclusive is needed, the following function is used:

```
uint32_t tinymt32_generate_uint32 (tinymt32_t * s);
```

Of course, the `tinymt32_t` structure must be left unchanged by the caller between successive calls to this function.

3.3. Specific Implementation Validation and Deterministic Behavior

PRNG determinism, for a given seed, can be a requirement (e.g., with [\[RLC-ID\]](#)). Consequently, any implementation of the TinyMT32 PRNG in line with this specification MUST have the same output as that provided by the reference implementation of Figure 1. In order to increase the compliancy confidence, this document proposes the following criteria. Using a seed value of 1, the first 50 values returned by `tinymt32_generate_uint32(s)` as 32-bit unsigned integers are equal to values provided in Figure 2, to be read line by line. Note that these values come from the `tinymt/check32.out.txt` file provided by the PRNG authors to validate implementations of TinyMT32, as part of the MersenneTwister-Lab/TinyMT Github repository.

3384709977  1723175122  3866752252   521822317  2292524454
```

Figure 2: First 50 decimal values (to be read per line) returned by `tinymt32_generate_uint32(s)` as 32-bit unsigned integers, with a seed value of 1.

In particular, the deterministic behavior of the Figure 1 source code has been checked across several platforms: high-end laptops running 64-bits Mac OSX and Linux/Ubuntu; a board featuring a 32-bits ARM Cortex-A15 and running 32-bit Linux/Ubuntu; several embedded cards

featuring either an ARM Cortex-M0+, a Cortex-M3 or a Cortex-M4 32-bit microcontroller, all of them running RIOT [[Baccelli18](#)]; two low-end embedded cards featuring either a 16-bit microcontroller (TI MSP430) or a 8-bit microcontroller (Arduino ATMEGA2560), both of them running RIOT.

This specification only outputs 32-bit unsigned pseudo-random numbers and does not try to map this output to a smaller integer range (e.g., between 10 and 49 inclusive). If a specific use-case needs such a mapping, it will have to provide its own function. In that case, if PRNG determinism is also required, the use of floating point (single or double precision) to perform this mapping should probably be avoided, these calculations leading potentially to different rounding errors across different target platforms. Great care should also be put on not introducing biases in the randomness of the mapped output (it may be the case with some mapping algorithms) incompatible with the use-case requirements. The details of how to perform such a mapping are out-of-scope of this document.

[4.](#) Security Considerations

The authors do not believe the present specification generates specific security risks per se. However, neither the TinyMT nor MT PRNG are meant to be used for cryptographic applications.

[5.](#) IANA Considerations

This document does not require any IANA action.

[6.](#) Acknowledgments

The authors would like to thank Belkacem Teibi with whom we explored TinyMT32 specificities when looking to an alternative to the Park-Miller Linear Congruential PRNG. The authors would like to thank Carl Wallace, Stewart Bryant, Greg Skinner, Mike Heard, the three TSVWG chairs, Wesley Eddy, our shepherd, David Black and Gorry Fairhurst, as well as Spencer Dawkins and Mirja Kuhlewind. Last but not least, the authors are really grateful to the IESG members, in particular Benjamin Kaduk, Eric Rescorla, Adam Roach, Roman Danyliw, Barry Leiba, Martin Vigoureux, Eric Vyncke for their highly valuable feedbacks that greatly contributed to improve this specification.
