**Large-Scale Broadband Measurement Enterprise Use-Case**  
**draft-inacio-lmap-enterprise-use-case-00**

Abstract

The Large-Scale Measurement of Broadband Performance (LMAP) working group is defining mechanisms to monitor network performance of large-scale networks. The use case will describe how very large enterprise networks are not very different from the networks considered by other LMAP use cases and that most measurements are useful to both use cases. In addition this use case will state the need for the ability to have finer grained observation related to User Experience potentially on a per application basis.

Status of this Memo

This Internet-Draft is submitted to IETF in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at

## **1 Introduction**

The Large-Scale Measurement of Broadband Performance (LMAP) working group is charged with creating a uniform Information Model in order to measure large-scale network performance. In addition to the Information Model, the working group is charged with creating a Control Protocol and a Report Protocol with their associated data models.

The Information Model and associated Data Models necessary for monitoring and regulating Internet Service Provider (ISP) networks are closely shared with the monitoring of large scale enterprise networks. In large scale enterprises, with multiple campuses distributed throughout countries or throughout the world, monitoring campus scale network activity and cross-campus network activity is closely related to monitoring ISP activity.

The additional considerations for this large scale enterprise monitoring are the needs to be able to be able to make measurements aligned to enterprise applications and services beyond simple bandwidth and latency measurements.

### **1.1 Terminology**

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC 2119](#) [[RFC2119](#)].

## **2. Large Scale Enterprise Use Case**

### **2.1 Similarities and Differences to ISPs and broadband users**

Many large scale enterprises centralized critical and/or expensive resources at a few select locations. For example, login directory services due to their critical role in the infrastructure and security needs, email and calendaring systems, and certain accounting and human resource functions. In large scale multinational organizations, these daily use resources may exist on a different continent than portions of the user base, with complex networks existing at both the remote location and where the critical resource is located.

Users of these large scale networks have similar needs from their network providers (usually an internal sub-organization) that general broadband users expect from their ISP. Depending on the organization, the service level agreement (SLA) may be more or less

[Page 3]

strict. The users within these organizations have the same need to diagnose and verify the performance provided to them as broadband users. Similarly, the sub-organization (referred to as IT (information technology) for the rest of this document) has the same need to test, measure, diagnose, and repair the network as a broadband ISP.

The difference between the enterprise users and typical broadband users is their requirement for special SLAs for certain critical resources within their global corporate network. Certain operations within the corporate network, when performing poorly at the global level, may have a disproportionate impact on the users experience when those SLAs are violated. The second issue is that often the IT component within an enterprise is responsible for both application performance and network performance.

## **[2.2](#) Additions for Enterprise Measurement**

Many large enterprises with geographically distributed resources partition their network monitoring related to geographic sub-units of the enterprise. The lack of uniform measurement and models means that problems that occur across sites are often not solved without significant user pressure.

The additional metrics necessary include the ability to distinguish application specific traffic flows in a passive manner and report on the performance end-to-end. Combining this data with typical network performance data, nominally: bandwidth, latency, routing, etc. allows a fine grained view of network activity and resource utilization.

## **[2.3](#) The Goal for Enhanced Measurement**

The goal of being able to measure the network in holistic ways that can be related to application experience is to answer the age old question: Is it the network or the application? By adding the ability to optionally measure in ways associated to application specific traffic, determining network impact to user experience will be possible.

## **[3](#) Requirements**

- \* Passive monitoring of application related network measurements.
- \* Non-averaged recording of application network data.
- \* Ability to correlate application related network measurements to non-application related network measurements.

Christopher Inacio

Expires January 31, 2014

[Page 4]

- \* Ability to track, at possibly per-packet activity level, performance measurements of specific flows, possibly sampled
- \* Ideally, a way for applications to announce themselves to the network for passive measurement.
- \* Simple uniform methods (common ports, DPI) to inspect traffic to associate the traffic with application usage

## **4 Security Considerations**

Security considerations are appropriate and necessary within the Control Protocol and the Report Protocol.

## **5 IANA Considerations**

None.
