

**XChaCha: eXtended-nonce ChaCha and AEAD\_XChaCha20\_Poly1305  
draft-irtf-cfrg-xchacha-01**

## Abstract

The eXtended-nonce ChaCha cipher construction (XChaCha) allows for ChaCha-based ciphersuites to accept a 192-bit nonce with similar guarantees to the original construction, except with a much lower probability of nonce misuse occurring. This helps for long running TLS connections. This also enables XChaCha constructions to be stateless, while retaining the same security assumptions as ChaCha.

This document defines XChaCha20, which uses HChaCha20 to convert the key and part of the nonce into a subkey, which is in turn used with the remainder of the nonce with ChaCha20 to generate a pseudorandom keystream (e.g. for message encryption).

This document also defines AEAD\_XChaCha20\_Poly1305, a variant of [[RFC7539](#)] that utilizes the XChaCha20 construction in place of ChaCha20.

## 1. Introduction

AEAD constructions (Authenticated Encryption with Associated Data) allow for message confidentiality to be assured even in the presence of adaptive chosen-ciphertext attacks, but they're known to be brittle to nonce-misuse conditions [1].

Arciszewski

Expires January 24, 2020

[Page 2]

Several nonce misuse resistant cipher constructions have been proposed over the years, including AES-SIV ([[RFC5297](#)]), AES-GCM-SIV [[2](#)], and several CAESAR candidates [[3](#)].

However, misuse resistant cipher constructions come at a cost in performance as they must necessarily make two passes over the message to be encrypted. An alternative strategy can significantly reduce the chance of accidental nonce reuse in environments where a large number of messages are encrypted. Simply use a large enough nonce such that applications can generate them randomly for each message and the probability of a collision remains low.

To this end, we propose a solution that is already implemented in many software projects that extends the nonce of ChaCha20 to 192 bits and uses it to build an AEAD construction.

### [1.1.](#) Notation and Conventions

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC 2119](#) [[RFC2119](#)].

## [2.](#) AEAD\_XChaCha20\_Poly1305

XChaCha20-Poly1305 is a variant of the ChaCha20-Poly1305 AEAD construction as defined in [[RFC7539](#)] that uses a 192-bit nonce instead of a 96-bit nonce.

The algorithm for XChaCha20-Poly1305 is as follows:

1. Calculate a subkey from the first 16 bytes of the nonce and the key, using HChaCha20 ([Section 2.2](#)).
2. Use the subkey and remaining 8 bytes of the nonce (prefixed with 4 NUL bytes) with AEAD\_CHACHA20\_POLY1305 from [[RFC7539](#)] as normal. The definition for XChaCha20 is given in [Section 2.3](#).

XChaCha20-Poly1305 implementations already exist in WireGuard [[4](#)], libsodium [[5](#)], xsecretbox [[6](#)], Tink [[7](#)], and in Go's crypto/chacha20poly1305 [[8](#)] library.

Similarly, Google's HPolyC [[9](#)] implements XChaCha12.

LibreSSL [[10](#)] has already implemented XChaCha20-Poly1305.

Note that the construction we're building upon uses the IETF's ChaCha20 (96-bit nonce), not Bernstein's ChaCha20 (64-bit nonce).

Arciszewski

Expires January 24, 2020

[Page 3]

## [2.1.](#) Motivation for XChaCha20-Poly1305

The nonce used by the original ChaCha20-Poly1305 is too short to safely use with random strings for long-lived keys.

XChaCha20-Poly1305 does not have this restriction.

By generating a subkey from a 128-bit nonce and the key, a reuse of only the latter 64 bits of the nonce isn't security-affecting, since the key (and thus, keystream) will be different. Additionally a reuse of only the first 128 bits of the nonce isn't security-affecting, as the nonce derived from the latter 64 bits is different.

Assuming a secure random number generator, random 192-bit nonces should experience a single collision (with probability 50%) after roughly  $2^{96}$  messages (approximately  $7.2998163e+28$ ). A more conservative threshold ( $2^{-32}$  chance of collision) still allows for  $2^{80}$  messages to be sent under a single key.

Therefore, with XChaCha20-Poly1305, users can safely generate a random 192-bit nonce for each message and not worry about nonce-reuse vulnerabilities.

As long as ChaCha20-Poly1305 is a secure AEAD cipher and ChaCha is a secure pseudorandom function (PRF), XChaCha20-Poly1305 is secure.

## [2.2.](#) HChaCha20

\*HChaCha20\* is an intermediary step towards XChaCha20 based on the construction and security proof used to create XSalsa20 [11], an extended-nonce Salsa20 variant used in NaCl [12].

HChaCha20 is initialized the same way as the ChaCha cipher, except that HChaCha20 uses a 128-bit nonce and has no counter. Instead, the block counter is replaced by the first 32 bits of the nonce.

Consider the two figures below, where each non-whitespace character represents one nibble of information about the ChaCha states (all numbers little-endian):

cccccccc	cccccccc	cccccccc	cccccccc
kkkkkkkk	kkkkkkkk	kkkkkkkk	kkkkkkkk
kkkkkkkk	kkkkkkkk	kkkkkkkk	kkkkkkkk
bbbbbbbb	nnnnnnnn	nnnnnnnn	nnnnnnnn

ChaCha20 State: c=constant k=key b=blockcount n=nonce

Arciszewski

Expires January 24, 2020

[Page 4]

```

cccccccc cccccccc cccccccc cccccccc
kkkkkkkk kkkkkkkk kkkkkkkk kkkkkkkk
kkkkkkkk kkkkkkkk kkkkkkkk kkkkkkkk
nnnnnnnn nnnnnnnn nnnnnnnn nnnnnnnn

```

HChaCha20 State: c=constant k=key n=nonce

After initialization, proceed through the ChaCha rounds as usual.

Once the 20 ChaCha rounds have been completed, the first 128 bits and last 128 bits of the ChaCha state (both little-endian) are concatenated, and this 256-bit subkey is returned.

### 2.2.1. Test Vector for the HChaCha20 Block Function

- o Key = 00:01:02:03:04:05:06:07:08:09:0a:0b:0c:0d:0e:0f:10:11:12:13:  
14:15:16:17:18:19:1a:1b:1c:1d:1e:1f. The key is a sequence of octets with no particular structure before we copy it into the HChaCha state.
- o Nonce = (00:00:00:09:00:00:00:4a:00:00:00:00:31:41:59:27)

After setting up the HChaCha state, it looks like this:

```

61707865 3320646e 79622d32 6b206574
03020100 07060504 0b0a0908 0f0e0d0c
13121110 17161514 1b1a1918 1f1e1d1c
09000000 4a000000 00000000 27594131

```

ChaCha state with the key setup.

After running 20 rounds (10 column rounds interleaved with 10 "diagonal rounds"), the HChaCha state looks like this:

```

423b4182 fe7bb227 50420ed3 737d878a
0aa76448 7954cdf3 846acd37 7b3c58ad
77e35583 83e77c12 e0076a2d bc6cd0e5
d5e4f9a0 53a8748a 13c42ec1 dcecd326

```

HChaCha state after 20 rounds

HChaCha20 will then return only the first and last rows, in little endian, resulting in the following 256-bit key:

```

82413b42 27b27bfe d30e4250 8a877d73
a0f9e4d5 8a74a853 c12ec413 26d3ecdc

```

Resultant HChaCha20 subkey

Arciszewski

Expires January 24, 2020

[Page 5]

### [2.3.](#) XChaCha20

XChaCha20 can be constructed from an existing ChaCha20 implementation and HChaCha20. All one needs to do is:

1. Pass the key and the first 16 bytes of the 24-byte nonce to HChaCha20 to obtain the subkey.
2. Use the subkey and remaining 8 byte nonce with ChaCha20 as normal (prefixed by 4 NUL bytes, since [[RFC7539](#)] specifies a 12-byte nonce).

XChaCha20 is a stream cipher and offers no integrity guarantees without being combined with a MAC algorithm (e.g. Poly1305).

The same HChaCha20 subkey derivation can also be used in the context of an AEAD\_ChaCha20\_Poly1305 implementation to create AEAD\_XChaCha20\_Poly1305, as described in [Section 2](#). Note that, with the AEAD mode, the initial block counter is set to 1 instead of 0, since the first block is used to derive the one-time Poly1305 key.

#### [2.3.1.](#) XChaCha20 Pseudocode

```
xchacha20_encrypt(key, nonce, plaintext):
    subkey = hchacha20(key, nonce[0:15])
    chacha20_nonce = "\x00\x00\x00\x00" + nonce[16:23]
    blk_ctr = 0
    return chacha20_encrypt(subkey, chacha20_nonce, plaintext, blk_ctr)
```

## [3.](#) Security Considerations

The security of the XChaCha construction depends on both the security of the ChaCha stream cipher and the HChaCha intermediary step, for reasons explained in the XSalsa20 paper [[13](#)] (which our XChaCha construction is derived from).

Given that the 20-round ChaCha stream cipher (ChaCha20) is believed to be at least as secure as Salsa20, our only relevant security consideration involves HChaCha20.

### [3.1.](#) Proving XChaCha20 to be Secure

In the XSalsa20 paper, when HSalsa20 is defined, the author states, "The indices 0, 5, 10, 15, 6, 7, 8, 9 here were not chosen arbitrarily; the choice is important for the security proof later in this paper."

Arciszewski

Expires January 24, 2020

[Page 6]

In the analysis of Theorem 3.1 from the same paper (which covers generalized cascades), the author further states: "Note that this bound is affected less by the insecurity of H than by the insecurity of S."

This means that the security of HSalsa20 affects the security of XSalsa20 less than Salsa20 does, and the same applies to any generalized cascade following a similar construction.

However, we want to be sure that HChaCha is secure even if it's less security-affecting than ChaCha (which we already believe to be secure).

In Salsa20, the indices 0, 5, 10, 15 were populated with constants, while the indices 6, 7, 8, and 9 were populated by the nonce. The security proof for HSalsa20 relies on the definition of a function Q (specified in Theorem 3.3 of the paper) that provides two critical properties:

1. Q(i) is a public computation of H(i) and S(i).
2. Q(i) is a public computation of uniform random strings from uniform random strings.

Thus, HSalsa20 uses the same indices as the public inputs (constant + nonce) for its final output.

The reliance on public computation for the security proof makes sense, and can be applied to ChaCha with a slight tweak.

ChaCha is a slightly different construction than Salsa20: The constants occupy the indices at 0, 1, 2, 3. Meanwhile, the nonce populates indices 12, 13, 14, 15.

Consequently, we can extract a public computation from ChaCha20 by selecting these indices from HChaCha20's final state as the HChaCha20 output, and the same security proof can be used.

Therefore, if the argument that makes HSalsa20 secure is valid, then it also applies to HChaCha for the corresponding output indices.

HSalsa20:	0, 5, 10, 15, 6, 7, 8, 9
HChaCha:	0, 1, 2, 3, 12, 13, 14, 15

Input and output indices for the relevant security proof

If the 20-round HChaCha (HChaCha20) is secure, and the 20-round ChaCha20 is secure, then XChaCha20 is also secure.

[Page 7]

#### 4. IANA Considerations

This document defines a new stream cipher ("XChaCha20", see [Section 2.3](#)) and a new AEAD cipher construction ("XChaCha20-Poly1305", see [Section 2](#)).

A new entry in the "Authenticated Encryption with Associated Data (AEAD) Parameters" registry with the name "AEAD\_XCHACHA20\_POLY1305" should be assigned.

Name	Reference	Number Identifier
