CCNx Messages in TLV Format
draft-irtf-icnrg-ccnxmessages-06

Abstract

This document specifies version "1" of CCNx message TLV packet format, including the TLV types used by each message element and the encoding of each value. The semantics of CCNx messages follow the CCNx Semantics specification.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on May 2, 2018.

[1.](#) Introduction

This document specifies a Type-Length-Value (TLV) packet format and the TLV type and value encodings for CCNx messages. A full description of the CCNx network protocol, providing an encoding-free description of CCNx messages and message elements, may be found in [[CCN semantics](#)]. Several additional protocols specified in their own documents are in use that extend this specification.

This document specifies:

- o The TLV packet format.
- o The overall packet format for CCNx messages.
- o The TLV types used by CCNx messages.
- o The encoding of values for each type.
- o Top level types that exist at the outermost containment.
- o Interest TLVs that exist within Interest containment.
- o Content Object TLVs that exist within Content Object containment.

This document is supplemented by this document:

- o Message semantics: see [[CCN semantics](#)] for the protocol operation regarding Interest and Content Object, including the Interest Return protocol.
- o URI notation: see [[CCNx URI](#)] for the CCNx URI notation.

The type values in [Section 4](#) represent the values in common usage today. These values may change pending IANA assignments. All type values are relative to their parent containers. It is possible for a TLV to redefine a type value defined by its parent. For example, each level of a nested TLV structure might define a "type = 1" with a completely different meaning.

Packets are represented as 32-bit wide words using ASCII art. Due to the nested levels of TLV encoding and the presence of optional fields and variable sizes, there is no concise way to represent all possibilities. We use the convention that ASCII art fields enclosed by vertical bars "|" represent exact bit widths. Fields with a forward slash "/" are variable bit widths, which we typically pad out to word alignment for picture readability.

1.1. Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC 2119](#) [[RFC2119](#)].

2. Definitions

- o Name: A hierarchically structured variable length identifier. It is an ordered list of path segments, which may be variable length octet strings. In human-readable form, it is represented in URI format as ccnx:/path/part. There is no host or query string. See [[CCNxURI](#)] for complete details.
- o Interest: A message requesting a Content Object with a matching Name and other optional selectors to choose from multiple objects with the same Name. Any Content Object with a Name and optional selectors that matches the Name and optional selectors of the Interest is said to satisfy the Interest.
- o Content Object: A data object sent in response to an Interest request. It has an (optional) Name and a content payload that are bound together via cryptographic means.

3. Type-Length-Value (TLV) Packets

We use 16-bit Type and 16-bit Length fields to encode TLV based packets. This provides 64K different possible types and value field lengths of up to 64KiB. With 64K possible types, there should be sufficient space for basic protocol types, while also allowing ample room for experimentation, application use, and growth.

Specifically, the TLV types in the range 0x1000 - 0x1FFF are reserved for experimental use. These type values are reserved in all TLV container contexts. In the event that more space is needed, either for types or for length, a new version of the protocol would be needed. See [Section 3.3.2](#) for more information about organization specific TLVs.

The packet payload is a TLV encoding of the CCNx message, followed by optional Validation TLVs.

1																2																3															
0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1																
+-----+																+-----+																+-----+															
CCNx Message TLV																																/															
+-----+																+-----+																+-----+															
/ Optional CCNx ValidationAlgorithm TLV																																/															
+-----+																+-----+																+-----+															
/ Optional CCNx ValidationPayload TLV (ValidationAlg required)																																/															
+-----+																+-----+																+-----+															

This document describes the Version "1" TLV encoding.

After discarding the fixed and hop-by-hop headers the remaining PacketPayload should be a valid protocol message. Therefore, the PacketPayload always begins with a 4 byte TLV defining the protocol message (whether it is an Interest, Content Object, or other message type) and its total length. The embedding of a self-sufficient protocol data unit inside the fixed and hop-by-hop headers allows a network stack to discard the headers and operate only on the embedded message.

The range of bytes protected by the Validation includes the CCNx Message and the ValidationAlgorithm.

The ContentObjectHash begins with the CCNx Message and ends at the tail of the packet.

3.2. Fixed Headers

CCNx messages begin with an 8 byte fixed header (non-TLV format). The HeaderLength field represents the combined length of the Fixed and Hop-by-hop headers. The PacketLength field represents the entire Packet length.

A specific PacketType may assign meaning to the "PacketType specific fields".

The PacketPayload of a CCNx packet is the protocol message itself. The Content Object Hash is computed over the PacketPayload only, excluding the fixed and hop-by-hop headers as those might change from hop to hop. Signed information or Similarity Hashes should not include any of the fixed or hop-by-hop headers. The PacketPayload should be self-sufficient in the event that the fixed and hop-by-hop headers are removed.

- o Version: defines the version of the packet.
- o HeaderLength: The length of the fixed header (8 bytes) and hop-by-hop headers. The minimum value MUST be "8".
- o PacketType: describes forwarder actions to take on the packet.
- o PacketLength: Total octets of packet including all headers (fixed header plus hop-by-hop headers) and protocol message.
- o PacketType Specific Fields: specific PacketTypes define the use of these bits.

The PacketType field indicates how the forwarder should process the packet. A Request Packet (Interest) has PacketType PT_INTEREST, a Response (Content Object) has PacketType PT_CONTENT, and an InterestReturn Packet has PacketType PT_RETURN.

HeaderLength is the number of octets from the start of the packet (Version) to the end of the hop-by-hop headers. PacketLength is the number of octets from the start of the packet to the end of the packet.

The PacketType specific fields are reserved bits whose use depends on the PacketType. They are used for network-level signaling.

3.2.1. Interest Fixed Header

If the PacketType in the Fixed Header is PT_INTEREST, it indicates that the PacketPayload should be processed as an Interest message. For this type of packet, the Fixed Header includes a field for a HopLimit as well as Reserved and Flags fields. The Reserved field MUST be set to 0 in an Interest - this field will be set to a return code in the case of an Interest Return. There are currently no Flags defined, so this field MUST be set to 0.

1										2										3											
0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
Version										PT_INTEREST										PacketLength											
HopLimit										Reserved										Flags					HeaderLength						

[3.2.1.1.](#) Interest HopLimit

For an Interest message, the HopLimit is a counter that is decremented with each hop. It limits the distance an Interest may travel on the network. The node originating the Interest MAY put in any value - up to the maximum of 255. Each node that receives an Interest with a HopLimit decrements the value upon reception. If the value is 0 after the decrement, the Interest MUST NOT be forwarded off the node.

It is an error to receive an Interest with a 0 hop-limit from a remote node.

[3.2.2.](#) Content Object Fixed Header

If the PacketType in the Fixed Header is PT_CONTENT, it indicates that the PacketPayload should be processed as a Content Object message. A Content Object defines a Flags field, however there are currently no flags defined, so the Flags field must be set to 0.

1										2										3											
0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
Version										PT_CONTENT										PacketLength											
Reserved										Flags					HeaderLength																

[3.2.3.](#) InterestReturn Fixed Header

If the PacketType in the Fixed Header is PT_RETURN, it indicates that the PacketPayload should be processed as a returned Interest message. The only difference between this InterestReturn message and the original Interest is that the PacketType is changed to PT_RETURN and a ReturnCode is put into the Reserved octet. All other fields are unchanged. The purpose of this encoding is to prevent packet length changes so no additional bytes are needed to return an Interest to the previous hop. See [\[CCNSemantics\]](#) for a protocol description of this packet type.

										1										2										3									
0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1								
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+										+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+										+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																			
Version										PT_RETURN										PacketLength																			
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+										+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+										+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																			
HopLimit										ReturnCode										Flags HeaderLength																			
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+										+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+										+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+																			

[3.2.3.1.](#) InterestReturn HopLimit

This is the original Interest's HopLimit, as received. It is the value before being decremented at the current node (i.e. the received value).

[3.2.3.2.](#) InterestReturn Flags

These are the original Flags as set in the Interest.

[3.2.3.3.](#) Return Code

The numeric value assigned to the return types is defined below. This value is set by the node creating the Interest Return.

A return code of "0" MUST NOT be used, as it indicates that the returning system did not modify the Return Code field.

Type	Return Type
T_RETURN_NO_ROUTE	No Route
T_RETURN_LIMIT_EXCEEDED	Hop Limit Exceeded
T_RETURN_NO_RESOURCES	No Resources
T_RETURN_PATH_ERROR	Path Error
T_RETURN_PROHIBITED	Prohibited
T_RETURN_CONGESTED	Congested
T_RETURN_MTU_TOO_LARGE	MTU too large
T_RETURN_UNSUPPORTED_HASH_RESTRICTION	Unsupported ContentObjectHashRestriction
T_RETURN_MALFORMED_INTEREST	Malformed Interest

Table 2: Return Codes

3.3. Global Formats

This section defines global formats that may be nested within other TLVs.

3.3.1. Pad

The pad type may be used by protocols that prefer word-aligned data. The size of the word may be defined by the protocol. Padding 4-byte words, for example, would use a 1-byte, 2-byte, and 3-byte Length. Padding 8-byte words would use a (0, 1, 2, 3, 5, 6, 7)-byte Length.

A pad MAY be inserted after any TLV in the CCNx Message or in the Validation Dependent Data. In the remainder of this document, we will not show optional pad TLVs.

0 1 2 3 4 5 6 7 8 9	0 1 2 3 4 5 6 7 8 9	0 1 2 3 4 5 6 7 8 9
1	2	3
T_PAD	Length	
variable length pad MUST be zeros		

3.3.2. Organization Specific TLVs

Organization specific TLVs MUST use the T_ORG type. The Length field is the length of the organization specific information plus 3. The Value begins with the 3 byte organization number derived from the last three digits of the IANA Private Enterprise Numbers [[EpriseNumbers](#)], followed by the organization specific information.

3.3.3. Hash Format

Hash values are used in several fields throughout a packet. This TLV encoding is commonly embedded inside those fields to specify the specific hash function used and it's value. Note that the reserved TLV types are also reserved here for user-defined experimental functions.

The LENGTH field of the hash value MUST be less than or equal to the hash function length. If the LENGTH is less than the full length, it is taken as the left LENGTH bytes of the hash function output. Only the specified truncations are allowed.

This nested format is used because it allows binary comparison of hash values for certain fields without a router needing to understand a new hash function. For example, the KeyIdRestriction is bit-wise compared between an Interest's KeyIdRestriction field and a ContentObject's KeyId field. This format means the outer field values do not change with differing hash functions so a router can still identify those fields and do a binary comparison of the hash TLV without need to understand the specific hash used. An alternative approach, such as using T_KEYID_SHA512-256, would require each router keep an up-to-date parser and supporting user-defined hash functions here would explode the parsing state-space.

A CCN entity MUST support the hash type T_SHA-256. An entity MAY support the remaining hash types.

Abbrev	Lengths (octets)
T_SHA-256	32
T_SHA-512	64, 32
n/a	Experimental TLV types

Table 3: CCNx Hash Functions

1										2										3											
0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
T_F00																				36											
T_SHA512																				32											
/ 32-byte hash value /																															

Example nesting inside type T_F00

3.3.4. Link

A Link is the tuple: {Name, [KeyIdRestr], [ContentObjectHashRestr]}. It is a general encoding that is used in both the payload of a Content Object with PayloadType = "Link" and in the KeyLink field in a KeyLocator.

										1										2										3									
0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1								
+-----+-----+-----+																																							
/ Mandatory CCNx Name																														/									
+-----+-----+-----+																																							
/ Optional KeyIdRestriction																														/									
+-----+-----+-----+																																							
/ Optional ContentObjectHashRestriction																														/									
+-----+-----+-----+																																							

3.4. Hop-by-hop TLV headers

Hop-by-hop TLV headers are unordered and meaning MUST NOT be attached to their ordering. Three hop-by-hop headers are described in this document:

Abbrev	Name	Description
T_INTLIFE	Interest Lifetime (Section 3.4.1)	The time an Interest should stay pending at an intermediate node.
T_CACHETIME	Recommended Cache Time (Section 3.4.2)	The Recommended Cache Time for Content Objects.
T_MSGHASH	Message Hash (Section 3.4.3)	The hash of the CCNx Message to end of packet using Section 3.3.3 format.

Table 4: Hop-by-hop Header Types

Additional hop-by-hop headers are defined in higher level specifications such as the fragmentation specification.

[3.4.1. Interest Lifetime](#)

The Interest Lifetime is the time that an Interest should stay pending at an intermediate node. It is expressed in milliseconds as an unsigned, network byte order integer.

A value of 0 (encoded as 1 byte %x00) indicates the Interest does not elicit a Content Object response. It should still be forwarded, but no reply is expected.

[3.4.2. Recommended Cache Time](#)

The Recommended Cache Time (RCT) is a measure of the useful lifetime of a Content Object as assigned by a content producer or upstream node. It serves as a guideline to the Content Store cache in determining how long to keep the Content Object. It is a recommendation only and may be ignored by the cache. This is in

contrast to the ExpiryTime (described in [Section 3.6.2.2.2](#)) which takes precedence over the RCT and must be obeyed.

Because the Recommended Cache Time is an optional hop-by-hop header and not a part of the signed message, a content producer may re-issue a previously signed Content Object with an updated RCT without needing to re-sign the message. There is little ill effect from an attacker changing the RCT as the RCT serves as a guideline only.

The Recommended Cache Time (a millisecond timestamp) is a network byte ordered unsigned integer of the number of milliseconds since the epoch in UTC of when the payload expires. It is a 64-bit field.

[3.4.3. Message Hash](#)

Within a trusted domain, an operator may calculate the message hash at a border device and insert that value into the hop-by-hop headers of a message. An egress device should remove the value. This permits intermediate devices within that trusted domain to match against a ContentObjectHashRestriction without calculating it at every hop.

The message hash is a cryptographic hash from the start of the CCNx Message to the end of the packet. It is used to match against the ContentObjectHashRestriction ([Section 3.6.2.1.2](#)). The Message Hash may be of longer length than an Interest's restriction, in which case the device should use the left bytes of the Message Hash to check against the Interest's value.

The Message Hash may only carry one hash type and there may only be one Message Hash header.

The Message Hash header is unprotected, so this header is only of practical use within a trusted domain, such as an operator's autonomous system.

Message Hash Header

3.5. Top-Level Types

The top-level TLV types listed below exist at the outermost level of a CCNx protocol message.

Abbrev	Name	Description
T_INTEREST	Interest (Section 3.6)	An Interest MessageType.
T_OBJECT	Content Object (Section 3.6)	A Content Object MessageType
T_VALIDATION_ALG	Validation Algorithm (Section 3.6.4.1)	The method of message verification such as Message Integrity Check (MIC), a Message Authentication Code (MAC), or a cryptographic signature.
T_VALIDATION_PAYLOAD	Validation Payload (Section 3.6.4.2)	The validation output, such as the CRC32C code or the RSA signature.

Table 5: CCNx Top Level Types

3.6. CCNx Message

This is the format for the CCNx protocol message itself. The CCNx message is the portion of the packet between the hop-by-hop headers and the Validation TLVs. The figure below is an expansion of the

										1										2										3																			
0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1

Name TLV										(Type = T_NAME)																																							
+-----+-----+-----+-----+										+-----+-----+-----+-----+										+-----+-----+-----+-----+										+-----+-----+-----+-----+																			
/ Optional Message TLVs										(Various Types)																				/																			
+-----+-----+-----+-----+										+-----+-----+-----+-----+										+-----+-----+-----+-----+										+-----+-----+-----+-----+																			
/ Optional Payload TLV										(Type = T_PAYLOAD)																				/																			
+-----+-----+-----+-----+										+-----+-----+-----+-----+										+-----+-----+-----+-----+										+-----+-----+-----+-----+																			

Abbrev	Name	Description
T_NAME	Name (Section 3.6.1)	The CCNx Name requested in an Interest or published in a Content Object.
T_PAYLOAD	Payload (Section 3.6.3)	The message payload.

Table 6: CCNx Message Types

3.6.1. Name

As described in CCNx Semantics [[CCNxSemantics](#)], using the CCNx URI [[CCNxURI](#)] notation, a T_NAME with 0 length corresponds to ccnx:/ (the default route) and is distinct from a name with one zero length segment, such as ccnx:/NAME=. In the TLV encoding, ccnx:/ corresponds to T_NAME with 0 length, while ccnx:/NAME= corresponds to T_NAME with 4 length and T_NAMESEGMENT with 0 length.

1										2										3											
0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
T_NAME										Length																					
/ Name segment TLVs																														/	
Symbolic Name										Name										Description											
T_NAMESEGMENT										Name segment (Section 3.6.1.1)										A generic name Segment.											
T_IPID										Interest Payload ID (Section 3.6.1.2)										An identifier that represents the Interest Payload field. As an example, the Payload ID might be a hash of the Interest Payload. This provides a way to differentiate between Interests based on their payloads without having to parse all the bytes of the payload itself; instead using only this Payload ID Name segment.											
T_APP:00 - T_APP:4096										Application Components (Section 3.6.1.1)										Application-specific payload in a name segment. An application may apply its own semantics to the 4096 reserved types.											

Table 7: CCNx Name Types

3.6.1.1. Name Segments

4096 special application payload name segments are allocated. These have application semantics applied to them. A good convention is to put the application's identity in the name prior to using these name segments.

For example, a name like "ccnx:/foo/bar/hi" would be encoded as:

1										2										3											
0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
+-----																															

3.6.1.2. Interest Payload ID

The InterestPayloadID is a name segment created by the origin of an Interest to represent the Interest Payload. This allows the proper multiplexing of Interests based on their name if they have different payloads. A common representation is to use a hash of the Interest Payload as the InterestPayloadID.

As part of the TLV 'value', the InterestPayloadID contains a one identifier of method used to create the InterestPayloadID followed by a variable length octet string. An implementation is not required to implement any of the methods to receive an Interest; the InterestPayloadID may be treated only as an opaque octet string for purposes of multiplexing Interests with different payloads. Only a device creating an InterestPayloadID name segment or a device verifying such a segment need to implement the algorithms.

It uses the [Section 3.3.3](#) encoding of hash values.

In normal operations, we recommend displaying the InterestPayloadID as an opaque octet string in a CCNx URI, as this is the common denominator for implementation parsing.

The InterestPayloadID, even if it is a hash, should not convey any security context. If a system requires confirmation that a specific entity created the InterestPayload, it should use a cryptographic signature on the Interest via the ValidationAlgorithm and ValidationPayload or use its own methods inside the Interest Payload.

3.6.2.1.2. ContentObjectHashRestriction

An Interest MAY contain a ContentObjectHashRestriction selector. This is the hash of the Content Object - the self-certifying name restriction that must be verified in the network, if an Interest carried this restriction. It is calculated from the beginning of the CCNx Message to the end of the packet. The LENGTH MUST be from one of the allowed values for that hash (see [Section 3.3.3](#)).

The ContentObjectHashRestriction SHOULD be of type T_SHA-256 and of length 32 bytes.

1										2										3																			
0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1

/ Optional ExpiryTime TLV																														/									
+-----+-----+-----+-----+										+-----+-----+-----+-----+										+-----+-----+-----+-----+										+-----+-----+-----+-----+									

Abbrev	Name	Description
T_PAYLDTYPE	PayloadType (Section 3.6.2.2.1)	Indicates the type of Payload contents.
T_EXPIRY	ExpiryTime (Section 3.6.2.2.2)	The time at which the Payload expires, as expressed in the number of milliseconds since the epoch in UTC. If missing, Content Object may be used as long as desired.

Table 9: CCNx Content Object Message TLV Types

[3.6.2.2.1](#). PayloadType

The PayloadType is a network byte order integer representing the general type of the Payload TLV.

- o T_PAYLOADTYPE_DATA: Data (possibly encrypted)
- o T_PAYLOADTYPE_KEY: Key
- o T_PAYLOADTYPE_LINK: Link

The Data type indicate that the Payload of the ContentObject is opaque application bytes. The Key type indicates that the Payload is a DER encoded public key. The Link type indicates that the Payload is one or more Link ([Section 3.3.4](#)). If this field is missing, a "Data" type is assumed.

[3.6.2.2.2](#). ExpiryTime

The ExpiryTime is the time at which the Payload expires, as expressed by a timestamp containing the number of milliseconds since the epoch in UTC. It is a network byte order unsigned integer in a 64-bit field. A cache or end system should not respond with a Content Object past its ExpiryTime. Routers forwarding a Content Object do

not need to check the ExpiryTime. If the ExpiryTime field is missing, the Content Object has no expressed expiration and a cache or end system may use the Content Object for as long as desired.

3.6.3. Payload

The Payload TLV contains the content of the packet. It MAY be of zero length. If a packet does not have any payload, this field MAY be omitted, rather than carrying a zero length.

3.6.4. Validation

Both Interests and Content Objects have the option to include information about how to validate the CCNx message. This information is contained in two TLVs: the ValidationAlgorithm TLV and the ValidationPayload TLV. The ValidationAlgorithm TLV specifies the mechanism to be used to verify the CCNx message. Examples include verification with a Message Integrity Check (MIC), a Message Authentication Code (MAC), or a cryptographic signature. The ValidationPayload TLV contains the validation output, such as the CRC32C code or the RSA signature.

An Interest would most likely only use a MIC type of validation - a crc, checksum, or digest.

3.6.4.1. Validation Algorithm

The ValidationAlgorithm is a set of nested TLVs containing all of the information needed to verify the message. The outermost container has type = T_VALIDATION_ALG. The first nested TLV defines the specific type of validation to be performed on the message. The type

is identified with the "ValidationType" as shown in the figure below and elaborated in the table below. Nested within that container are the TLVs for any ValidationType dependent data, for example a Key Id, Key Locator etc.

Complete examples of several types may be found in [Section 3.6.4.1.5](#)

1										2										3											
0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
T_VALIDATION_ALG										ValidationAlgLength																					
ValidationType										Length																					
/ ValidationType dependent data																														/	
Abbrev										Name										Description											
T_CRC32C										CRC32C (Section 3.6.4.1.1)										Castagnoli CRC32 (iSCSI, ext4, etc.), with normal form polynomial 0x1EDC6F41.											
T_HMAC-SHA256										HMAC-SHA256 (Section 3.6.4.1.2)										HMAC (RFC 2104) using SHA256 hash.											
T_RSA-SHA256										RSA-SHA256 (Section 3.6.4.1.3)										RSA public key signature using SHA256 digest.											
EC-SECP-256K1										SECP-256K1 (Section 3.6.4.1.3)										Elliptic Curve signature with SECP-256K1 parameters (see [ECC]).											
EC-SECP-384R1										SECP-384R1 (Section 3.6.4.1.3)										Elliptic Curve signature with SECP-384R1 parameters (see [ECC]).											

Table 10: CCNx Validation Types

[3.6.4.1.1](#). Message Integrity Checks

MICs do not require additional data in order to perform the verification. An example is CRC32C that has a "0" length value.

3.6.4.1.2. Message Authentication Checks

MACs are useful for communication between two trusting parties who have already shared private keys. Examples include an RSA signature of a SHA256 digest or others. They rely on a KeyId. Some MACs might use more than a KeyId, but those would be defined in the future.

3.6.4.1.3. Signature

Signature type Validators specify a digest mechanism and a signing algorithm to verify the message. Examples include RSA signature of a SHA256 digest, an Elliptic Curve signature with SECP-256K1 parameters, etc. These Validators require a KeyId and a mechanism for locating the publishers public key (a KeyLocator) - optionally a PublicKey or Certificate or KeyLink.

3.6.4.1.4. Validation Dependent Data

Different Validation Algorithms require access to different pieces of data contained in the ValidationAlgorithm TLV. As described above, Key Ids, Key Locators, Public Keys, Certificates, Links and Key Names all play a role in different Validation Algorithms. Any number of Validation Dependent Data containers can be present in a Validation Algorithm TLV.

Following is a table of CCNx ValidationType dependent data types:

Abbrev	Name	Description
T_KEYID	SignerKeyId (Section 3.6.4.1.4.1)	An identifier of the shared secret or public key associated with a MAC or Signature.
T_PUBLICKEY	Public Key (Section 3.6.4.1.4.2)	DER encoded public key.
T_CERT	Certificate (Section 3.6.4.1.4.3)	DER encoded X509 certificate.
T_KEYLINK	KeyLink (Section 3.6.4.1.4.4)	A CCNx Link object.
T_SIGTIME	SignatureTime (Section 3.6.4.1.4.5)	A millisecond timestamp indicating the time when the signature was created.

Table 11: CCNx Validation Dependent Data Types

3.6.4.1.4.1. KeyId

The KeyId is the publisher key identifier. It is similar to a Subject Key Identifier from X509 [RFC 5280, [Section 4.2.1.2](#)]. It should be derived from the key used to sign, such as from the SHA-256 hash of the key. It applies to both public/private key systems and to symmetric key systems.

The KeyId is represented using the [Section 3.3.3](#). If a protocol uses a non-hash identifier, it should use one of the reserved values.

1										2										3											
0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
T_KEYID										LENGTH+4																					
<hash type>										LENGTH																					
/																															
LENGTH octets of hash																															
/																															

any time associated with the actual CCNx Message, which could have been created long before the signature. The default behavior is to always include a SignatureTime when creating an authenticated message (e.g. HMAC or RSA).

SignatureTime is a network byte ordered unsigned integer of the number of milliseconds since the epoch in UTC of when the signature was created. It is a fixed 64-bit field.

[3.6.4.1.5](#). Validation Examples

As an example of a MIC type validation, the encoding for CRC32C validation would be:

As an example of a MAC type validation, the encoding for an HMAC using a SHA256 hash would be:

As an example of a Signature type validation, the encoding for an RSA public key signing using a SHA256 digest and Public Key would be:

4.1. Packet Type Registry

The following packet types should be allocated. A PacketType MUST be 1 byte. New packet types are allocated via "RFC Required" action.

Property	Value
Name	Packet Type Registry
Parent	CCNx Registry
Review process	RFC Required
Syntax	1 octet (decimal)

Registry Creation

Type	Name	Reference
0	PT_INTEREST	Fixed Header Types (Section 3.2)
1	PT_CONTENT	Fixed Header Types (Section 3.2)
2	PT_RETURN	Fixed Header Types (Section 3.2)

Packet Type Namespace

4.2. Interest Return Code Registry

The following InterestReturn code types should be allocated.

Property	Value
Name	Interest Return Code
Parent	CCNx Registry
Review process	Expert Review, should include public standard leading to RFC.
Syntax	1 octet (decimal)

Registry Creation

Type	Name	Reference
1	T_RETURN_NO_ROUTE	Fixed Header Types (Section 3.2.3.3)
2	T_RETURN_LIMIT_EXCEEDED	Fixed Header Types (Section 3.2.3.3)
3	T_RETURN_NO_RESOURCES	Fixed Header Types (Section 3.2.3.3)
4	T_RETURN_PATH_ERROR	Fixed Header Types (Section 3.2.3.3)
5	T_RETURN_PROHIBITED	Fixed Header Types (Section 3.2.3.3)
6	T_RETURN_CONGESTED	Fixed Header Types (Section 3.2.3.3)
7	T_RETURN_MTU_TOO_LARGE	Fixed Header Types (Section 3.2.3.3)
8	T_RETURN_UNSUPPORTED_HASH_RESTRICTION	Fixed Header Types (Section 3.2.3.3)
9	T_RETURN_MALFORMED_INTEREST	Fixed Header Types (Section 3.2.3.3)

Interest Return Type Namespace

4.3. Hop-by-Hop Type Registry

The following hop-by-hop types should be allocated.

Property	Value
Name	Hop-by-Hop Type Registry
Parent	CCNx Registry
Review process	RFC Required
Syntax	2 octet TLV type (decimal)

Registry Creation

Type	Name	Reference
1	T_INTLIFE	Hop-by-hop TLV headers (Section 3.4)
2	T_CACHETIME	Hop-by-hop TLV headers (Section 3.4)
3	T_MSGHASH	Hop-by-hop TLV headers (Section 3.4)
4 - 7	Reserved	
%x0FFE	T_PAD	Pad (Section 3.3.1)
%x0FFF	T_ORG	Organization-Specific TLVs (Section 3.3.2)
%x1000-%x1FFF	Reserved	Experimental Use (Section 3)

Hop-by-Hop Type Namespace

4.4. Top-Level Type Registry

The following top-level types should be allocated.

Property	Value
Name	Top-Level Type Registry
Parent	CCNx Registry
Review process	RFC Required
Syntax	2 octet TLV type (decimal)

Registry Creation

Type	Name	Reference
1	T_INTEREST	Top-Level Types (Section 3.5)
2	T_OBJECT	Top-Level Types (Section 3.5)
3	T_VALIDATION_ALG	Top-Level Types (Section 3.5)
4	T_VALIDATION_PAYLOAD	Top-Level Types (Section 3.5)

Top-Level Type Namespace

4.5. Name Segment Type Registry

The following name segment types should be allocated.

Property	Value
Name	Name Segment Type Registry
Parent	CCNx Registry
Review process	Expert Review with public specification
Syntax	2 octet TLV type (decimal)

Registry Creation

Type	Name	Reference
1	T_NAMESEGMENT	Name (Section 3.6.1)
2	T_IPID	Name (Section 3.6.1)
16 - 19	Reserved	Used in other drafts
%x0FFF	T_ORG	Organization-Specific TLVs (Section 3.3.2)
%x1000 - %x1FFF	T_APP:00 - T_APP:4096	Application Components (Section 3.6.1)

Name Segment Type Namespace

[4.6.](#) Message Type Registry

The following CCNx message segment types should be allocated.

Property	Value
Name	Message Type Registry
Parent	CCNx Registry
Review process	RFC Required
Syntax	2 octet TLV type (decimal)

Registry Creation

Type	Name	Reference
0	T_NAME	Message Types (Section 3.6)
1	T_PAYLOAD	Message Types (Section 3.6)
2	T_KEYIDRESTR	Message Types (Section 3.6)
3	T_OBHASHRESTR	Message Types (Section 3.6)
5	T_PAYLDTYPE	Content Object Message Types (Section 3.6.2.2)
6	T_EXPIRY	Content Object Message Types (Section 3.6.2.2)
7 - 12	Reserved	Used in other RFC drafts
%x0FFE	T_PAD	Pad (Section 3.3.1)
%x0FFF	T_ORG	Organization-Specific TLVs (Section 3.3.2)
%x1000-%x1FFF	Reserved	Experimental Use (Section 3)

CCNx Message Type Namespace

4.7. Payload Type Registry

The following payload types should be allocated.

Property	Value
Name	PayloadType Registry
Parent	CCNx Registry
Review process	Expert Review with public specification
Syntax	Variable length unsigned integer (decimal)

Registry Creation

Type	Name	Reference
0	T_PAYLOADTYPE_DATA	Payload Types (Section 3.6.2.2.1)
1	T_PAYLOADTYPE_KEY	Payload Types (Section 3.6.2.2.1)
2	T_PAYLOADTYPE_LINK	Payload Types (Section 3.6.2.2.1)

Payload Type Namespace

4.8. Validation Algorithm Type Registry

The following validation algorithm types should be allocated.

Property	Value
Name	Validation Algorithm Type Registry
Parent	CCNx Registry
Review process	Expert Review with public specification of the algorithm
Syntax	2 octet TLV type (decimal)

Registry Creation

Type	Name	Reference
2	T_CRC32C	Validation Algorithm (Section 3.6.4.1)
4	T_HMAC-SHA256	Validation Algorithm (Section 3.6.4.1)
5	T_RSA-SHA256	Validation Algorithm (Section 3.6.4.1)
6	EC-SECP-256K1	Validation Algorithm (Section 3.6.4.1)
7	EC-SECP-384R1	Validation Algorithm (Section 3.6.4.1)
%x0FFE	T_PAD	Pad (Section 3.3.1)
%x0FFF	T_ORG	Organization-Specific TLVs (Section 3.3.2)
%x1000-%x1FFF	Reserved	Experimental Use (Section 3)

Validation Algorithm Type Namespace

[4.9.](#) Validation Dependent Data Type Registry

The following validation dependent data types should be allocated.

Property	Value
Name	Validation Dependent Data Type Registry
Parent	CCNx Registry
Review process	RFC Required
Syntax	2 octet TLV type (decimal)

Registry Creation

Type	Name	Reference
9	T_KEYID	Validation Dependent Data (Section 3.6.4.1.4)
10	T_PUBLICKEYLOC	Validation Dependent Data (Section 3.6.4.1.4)
11	T_PUBLICKEY	Validation Dependent Data (Section 3.6.4.1.4)
12	T_CERT	Validation Dependent Data (Section 3.6.4.1.4)
13	T_LINK	Validation Dependent Data (Section 3.6.4.1.4)
14	T_KEYLINK	Validation Dependent Data (Section 3.6.4.1.4)
15	T_SIGTIME	Validation Dependent Data (Section 3.6.4.1.4)
%x0FFF	T_ORG	Organization-Specific TLVs (Section 3.3.2)
%x1000-%x1FFF	Reserved	Experimental Use (Section 3)

Validation Dependent Data Type Namespace

[4.10.](#) Hash Function Type Registry

The following CCNx hash function types should be allocated.

Property	Value
Name	Hash Function Type Registry
Parent	CCNx Registry
Review process	Expert Review with public specification of the hash function
Syntax	2 octet TLV type (decimal)

Registry Creation

Type	Name	Reference
1	T_SHA-256	Hash Format (Section 3.3.3)
2	T_SHA-512	Hash Format (Section 3.3.3)
%x0FFF	T_ORG	Organization-Specific TLVs (Section 3.3.2)
%x1000-%x1FFF	Reserved	Experimental Use (Section 3)

CCNx Hash Function Type Namespace

5. Security Considerations

The CCNx message format includes the ability to attach MICs, MACs, and Signatures to all packet types. This does not mean that it is a good idea to use an arbitrary ValidationAlgorithm, nor to include computationally expensive algorithms in Interest packets, as that could lead to computational DoS attacks. Application protocols should use an explicit protocol to guide their use of packet signatures.

The CCNx message format does not include explicit guidance for encryption. This is covered by other specifications.

Because some implementations may store the entire Name at intermediate hops, application designers should use concise names and not store large fields there. Deployments may choose to use their own guidelines for name limitations. There is currently no recommended practices for Interest deployments.
