**YANG Data Model for IEEE 1588v2
draft-jlx-tictoc-1588v2-yang-01.txt**

Status of this Memo

This Internet-Draft is submitted to IETF in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/1id-abstracts.txt>

The list of Internet-Draft Shadow Directories can be accessed at <http://www.ietf.org/shadow.html>

This Internet-Draft will expire on April 16, 2016.

Section 4.e of the [Trust Legal Provisions](#) and are provided without warranty as described in the Simplified BSD License.

Abstract

This document defines a YANG data model for the configuration of IEEE 1588v2 devices and clocks, and also retrieval of the configuration information, data set and running states of IEEE 1588v2 clocks.

[1.](#) Introduction

As a synchronization protocol, IEEE 1588v2 [[IEEE1588](#)] is widely supported in the carrier networks. It can provide high precision time synchronization as high as nano-seconds. The protocol depends on a Precision Time Protocol (PTP) engine to automatically decide its state, and a PTP transportation layer to carry the PTP timing and various quality messages. The configuration parameters and state data sets of IEEE 1588v2 are numerous.

Some work on IEEE 1588v2 MIB [[PTP-MIB](#)] is in progress in the IETF TICTOC WG. But the work is only scoped with retrieval of the state data of IEEE 1588v2 by Simple Network Management Protocol (SNMP) and configuration is not considered, thus its use is limited.

Some service providers require the management of the IEEE 1588v2 synchronization network can be more flexible and more Internet-based (typically overlaid on their transport networks). Software Defined Network (SDN) is another driving factor which demands a greater control over synchronization networks.

YANG [[RFC6020](#)] is a data modeling language used to model configuration and state data manipulated by the Network Configuration Protocol (NETCONF) [[RFC6241](#)]. A small set of built-in data types are defined in [[RFC6020](#)], and a collection of common data types are further defined in [[RFC6991](#)]. Advantages of YANG include Internet based configuration capability, validation, roll-back and etc., all these characteristics make it attractive to become a modeling language for IEEE 1588v2.

This document defines a YANG [[RFC6020](#)] data model for the configuration of IEEE 1588v2 devices and clocks, and also retrieval of the state data of IEEE 1588v2 clocks.

In order to fulfill the need of a lightweight implementation, the core module is designed to be generic and minimal, but be extensible with capability negotiation. That is, if a node is verified with a capability of more functions, then more modules can be loaded on demand, otherwise, only a basic module is loaded on the node.

This document defines PTP system information, PTP data sets and running states following the structure and definitions in IEEE 1588v2, and compatible with [[PTP-MIB](#)]. The router specific 1588v2 information is out of scope of this document.

2. Conventions used in this document

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [[RFC2119](#)].

3. Terminology

Terminologies used in this document are extracted from [[IEEE1588](#)] and [[PTP-MIB](#)].

ARB	Arbitrary Timescale
BC	Boundary Clock
DS	Data Set
E2E	End-to-End
EUI	Extended Unique Identifier.
GPS	Global Positioning System

IANA	Internet Assigned Numbers Authority
IP	Internet Protocol
NIST	National Institute of Standards and Technology
NTP	Network Time Protocol
OC	Ordinary Clock
P2P	Peer-to-Peer
PTP	Precision Time Protocol
TAI	International Atomic Time
TC	Transparent Clock
UDP	User Datagram Protocol
UTC	Coordinated Universal Time

4. IEEE 1588V2 YANG Model hierarchy

This section describes the hierarchy of IEEE 1588v2 YANG module. Query and retrieval of device wide or port specific configuration information and clock data set is described for this version.

Query and retrieval of clock information include:

- Clock data set attributes in a clock node, including: current-DS, clock-parent-DS, default-DS, time-properties-DS, and transparentClock-default-DS.
- Port specific data set attributes, including: port-DS and transparentClock-port-DS.

  }
}
```

6. Security Considerations

YANG modules are designed to be accessed via the NETCONF protocol [[RFC6241](#)], thus security considerations in [[RFC6241](#)] apply here. Security measures such as using the NETCONF over SSH [[RFC6242](#)] and restricting its use with access control [[RFC6536](#)] can further improve its security, avoid injection attacks and misuse of the protocol.

Some data nodes defined in this YANG module are writable, and any changes to them may adversely impact a synchronization network.

7. IANA Considerations

This document registers a URI in the IETF XML registry, and the following registration is requested to be made:

URI: urn:ietf:params:xml:ns:yang:1588v2

This document registers a YANG module in the YANG Module Names:

name: 1588v2 namespace: urn:ietf:params:xml:ns:yang:1588v2
