JSON Web Signature JSON Serialization (JWS-JS)
draft-jones-json-web-signature-json-serialization-01

Abstract

   The JSON Web Signature JSON Serialization (JWS-JS) is a means of
   representing content secured with digital signatures or Hash-based
   Message Authentication Codes (HMACs) using JSON data structures.
   This specification describes a means of representing secured content
   as a JSON data object (as opposed to the JWS specification, which
   uses a compact serialization with a URL-safe representation). It
   enables multiple digital signatures and/or HMACs to be applied to the
   same content (unlike JWS). Cryptographic algorithms and identifiers
   used with this specification are enumerated in the separate JSON Web
   Algorithms (JWA) specification. The JSON Serialization for related
   encryption functionality is described in the separate JSON Web
   Encryption JSON Serialization (JWE-JS) specification.

Requirements Language

   The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT",
   "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this
   document are to be interpreted as described in RFC 2119 [RFC2119].

Status of this Memo

   This Internet-Draft is submitted in full conformance with the
   provisions of BCP 78 and BCP 79.

   Internet-Drafts are working documents of the Internet Engineering
   Task Force (IETF). Note that other groups may also distribute
   working documents as Internet-Drafts. The list of current Internet-
   Drafts is at http://datatracker.ietf.org/drafts/current/.

   Internet-Drafts are draft documents valid for a maximum of six months
   and may be updated, replaced, or obsoleted by other documents at any
   time. It is inappropriate to use Internet-Drafts as reference
   material or to cite them other than as "work in progress."

   This Internet-Draft will expire on September 13, 2012.

Table of Contents

1. Introduction

The JSON Web Signature JSON Serialization (JWS-JS) is a format for
representing content secured with digital signatures or Hash-based
Message Authentication Codes (HMACs) as a JSON [RFC4627] object. It
enables multiple digital signatures and/or HMACs to be applied to the
same content (unlike JWS [JWS]). The digital signature and HMAC
mechanisms used are independent of the type of content being secured,
allowing arbitrary content to be secured. Cryptographic algorithms
and identifiers used with this specification are enumerated in the
separate JSON Web Algorithms (JWA) [JWA] specification. The JSON
Serialization for related encryption functionality is described in
the separate JSON Web Encryption JSON Serialization (JWE-JS) [JWE-JS]
specification.

2. Terminology

This specification uses the same terminology as the JSON Web
Signature (JWS) [JWS] specification.

3. JSON Serialization

The JSON Serialization represents secured content as a JSON object
with members for each of three constituent parts: a "headers" member
whose value is a non-empty array of Encoded JWS Header values, a
"payload" member whose value is an Encoded JWS Payload value, and a
"signatures" member whose value is a non-empty array of Encoded JWS
Signature values, where the number of elements in both arrays is the
same.

Unlike the compact serialization used by JWSs, content using the JSON
Serialization MAY be secured with more than one digital signature
and/or HMAC value. Each is represented as an Encoded JWS Signature
in the "signatures" member array. For each, there is a corresponding
"headers" member array element that is an Encoded JWS Header
specifying the digital signature or HMAC applied to the Encoded JWS
Header value and the Encoded JWS Payload value to create the JWS
Signature value. Therefore, the syntax is:
```
{"headers":["<header 1 contents>",...,"<header N contents>"],
 "payload":"<payload contents>",
 "signatures":["<signature 1 contents>",...,"<signature N contents>"]
}
```

The contents of the Encoded JWS Header, Encoded JWS Payload, and
Encoded JWS Signature values are exactly as specified in JSON Web
Signature (JWS) [JWS]. They are interpreted and validated in the

same manner, with each corresponding "headers" and "signatures" value being created or validated together. The arrays MUST have the same number of elements.

The i'th JWS Signature value is computed on the JWS Secured Input corresponding to the concatenation of the i'th Encoded JWS Header, a period ('.') character, and the Encoded JWS Payload in the same manner described in the JWS specification. This has the desirable result that each Encoded JWS signature value in the "signatures" array is identical to the value that would be used for the same header and payload in a JWS.

4. Example JWS-JS

This section contains an example using the JWS JSON Serialization. This example demonstrates the capability for conveying multiple digital signatures and/or HMACs for the same payload.

The Encoded JWS Payload used in this example is the same as used in the examples in Appendix A of JWS (with line breaks for display purposes only):
eyJpc3MiOiJqb2UiLA0KICJleHAiOjEzMDA4MTkzODAsDQogImh0dHA6Ly9leGFt
cGxlLmNvbS9pc19yb290Ijp0cnVlfQ

Two digital signatures are used in this example: an RSA SHA-256 signature, for which the header and signature values are the same as in Appendix A.2 of JWS, and an ECDSA P-256 SHA-256 signature, for which the header and signature values are the same as in Appendix A.3 of JWS. The two Decoded JWS Header Segments used are:
{"alg":"RS256"}

and:
{"alg":"ES256"}

Since the computations of the JWS Header and JWS Signature values are the same as in Appendix A.2 and Appendix A.3 of JWS, they are not repeated here.

The complete JSON Web Signature JSON Serialization (JWS-JS) for these values is as follows (with line breaks for display purposes only):

```
{"headers":[
  "eyJhbGciOiJSUzI1NiJ9",
  "eyJhbGciOiJFUzI1NiJ9"],
 "payload":"eyJpc3MiOiJqb2UiLA0KICJleHAiOjEzMDA4MTkzODAsDQogImh0
dHA6Ly9leGFtcGxlLmNvbS9pc19yb290Ijp0cnVlfQ",
 "signatures":[
  "cC4hiUPoj9Eetdgtv3hF80EGrhuB__dzERat0XF9g2VtQgr9PJbu3XOiZj5RZ
mh7AAuHIm4Bh-0Qc_lF5YKt_O8W2Fp5jujGbds9uJdbF9CUAr7t1dnZcAcQjbKBY

PqvhJ1phCnvWh6IeYI2w9QOYEUipUTI8np6LbgGY9Fs98rqVt5AXLIhWkWywlVmt
VrBp0igcN_IoypGlUPQGe77Rw",
  "DtEhU3ljbEg8L38VWAfUAqOyKAM6-Xx-F4GawxaepmXFCgfTjDxw5djxLa8IS
lSApmWQxfKTUJqPP3-Kg6NU1Q"]
}
```

5. IANA Considerations

This specification makes no requests of IANA.

6. Security Considerations

The security considerations for this specification are the same as
those for the JSON Web Signature (JWS) [JWS] specification.

Appendix A. Acknowledgements

   JSON serializations for secured content were previously explored by
   Magic Signatures [MagicSignatures] and JSON Simple Sign [JSS].

Appendix B. Document History

   -01

   o Corrected the Magic Signatures reference.

   -00

   o Created the initial version incorporating JOSE working group input
      and drawing from the JSON Serialization previously proposed in
      draft-jones-json-web-token-01.
