YANG models for ACTN TE Performance Monitoring Telemetry and Network Autonomics

[draft-lee-teas-actn-pm-telemetry-autonomics-07](#)

Status of this Memo

This Internet-Draft is submitted to IETF in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at
<http://www.ietf.org/ietf/1id-abstracts.txt>

The list of Internet-Draft Shadow Directories can be accessed at
<http://www.ietf.org/shadow.html>.

This Internet-Draft will expire on January 2, 2019.

Abstract

Abstraction and Control of TE Networks (ACTN) refers to the set of virtual network operations needed to operate, control and manage large-scale multi-domain, multi-layer and multi-vendor TE networks, so as to facilitate network programmability, automation, efficient resource sharing.

This document provides YANG data models that describe Key Performance Indicator (KPI) telemetry and network autonomies for TE-tunnels and ACTN VNs.

1. Introduction

Abstraction and Control of TE Networks (ACTN) describes a method for operating a Traffic Engineered (TE) network (such as an MPLS-TE network or a layer 1/0 transport network) to provide connectivity and virtual network services for customers of the TE network [ACTN-Frame]. The services provided can be optimized to meet the requirements (such as traffic patterns, quality, and reliability) of the applications hosted by the customers. Data models are a representation of objects that can be configured or monitored within a system. Within the IETF, YANG [[RFC6020](#)] is the language of choice for documenting data models, and YANG models have been produced to allow configuration or modeling of a variety of network devices, protocol instances, and network services. YANG data models have been classified in [[Netmod-Yang-Model-Classification](#)] and [[Service-YANG](#)].

[ACTN-VN] describes how customers or end to end orchestrators can request and/or instantiate a generic virtual network service. [ACTN-Applicability] describes a connection between IETF YANG model classifications to ACTN interfaces. In particular, it describes the customer service model can be mapped into the CMI (CNC-MDSC Interface) of the ACTN architecture.

The YANG model on the ACTN CMI is known as customer service model in [[Service-YANG](#)]. [[PCEP-Service-Aware](#)] describes key network performance data to be considered for end-to-end path computation in TE networks. Key performance indicator is a term that describes critical performance data that may affect VN/TE service.

1.1. Terminology

1.2. Tree Structure - Legend

A simplified graphical representation of the data model is used in [Section 5](#) of this document. The meaning of the symbols in these diagrams is defined in [[RFC8342](#)].

1.3. Prefixes in Data Node Names

In this document, names of data nodes and other data model objects are prefixed using the standard prefix associated with the corresponding YANG imported modules, as shown in Table 1.

Prefix	YANG module	Reference
rt	ietf-routing-types	[Routing-Types]
te	ietf-te	[TE-tunnel]
te-types	ietf-te-types	[TE-Types]
te-kpi	ietf-te-kpi-telemetry	[This I-D]
vn	ietf-actn-vn	[ACTN-VN]
actn-tel	ietf-actn-te-kpi-telemetry	{This I-D}

Table 1: Prefixes and corresponding YANG modules

2. Use-Cases

[ACTN-PERF] describes use-cases relevant to this draft. It introduces the dynamic creation, modification and optimization of services based on the performance monitoring in the Abstraction and Control of Transport Networks (ACTN) architecture. Figure 1 shows a high-level workflows for dynamic service control based on traffic monitoring.

Some of the key points from [[ACTN-PERF](#)] are as follows:

- . Network traffic monitoring is important to facilitate automatic discovery of the imbalance of network traffic, and initiate the network optimization, thus helping the network operator or the virtual network service provider to use the network more efficiently and save CAPEX/OPEX.
- . Customer services have various SLA requirements, such as service availability, latency, latency jitter, packet loss rate, BER, etc. The transport network can satisfy service availability and BER requirements by providing different protection and restoration mechanisms. However, for other performance parameters, there are no such mechanisms. In order to provide high quality services according to customer SLA, one possible solution is to measure the service SLA related performance parameters, and dynamically provision and optimize services based on the performance monitoring results.
- . Performance monitoring in a large scale network could generate a huge amount of performance information. Therefore, the appropriate way to deliver the information in CMI and MPI interfaces should be carefully considered.

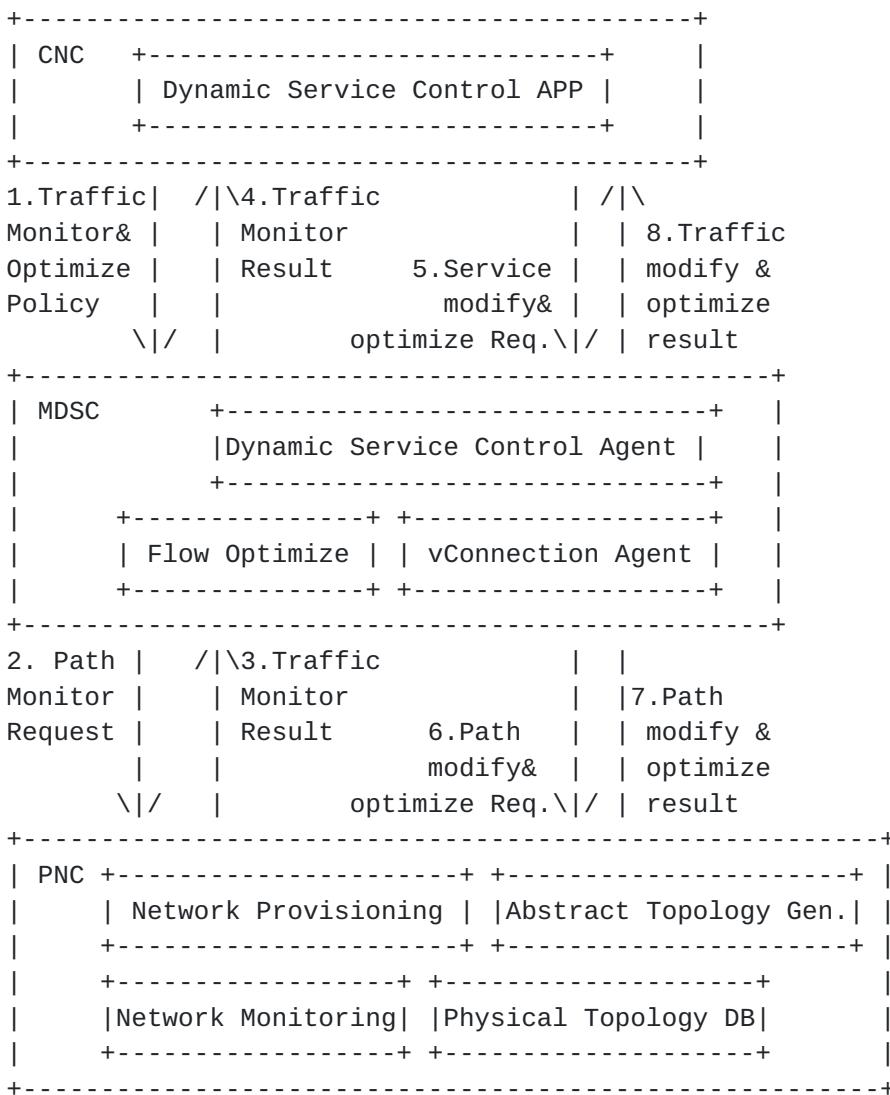

Figure 1 Workflows for dynamic service control based on traffic monitoring

3. Design of the Data Models

The YANG models developed in this document describe two models:

- (i) TE KPI Telemetry Model which provides the TE-Tunnel level of performance monitoring mechanism (See [Section 4](#) for details)
- (ii) ACTN TE KPI Telemetry Model which provides the VN level of the aggregated performance monitoring mechanism (See [Section 5](#) for details)

The models include -

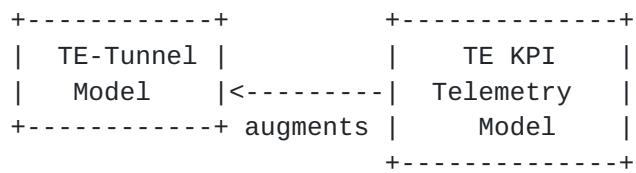

- (i) Performance Telemetry details as measured during the last interval, ex delay.
- (ii) Scaling Intent based on with TE/VN could be scaled in/out.

[Editor's Note - Need to decide if scaling and telemetry can be in the same model as per the current draft.]

3.1. TE KPI Telemetry Model

This module describes performance telemetry for TE-tunnel model. The telemetry data is augmented to tunnel state. This module also allows autonomic traffic engineering scaling intent configuration mechanism on the TE-tunnel level. Various conditions can be set for auto-scaling based on the telemetry data.

The TE KPI Telemetry Model augments the TE-Tunnel Model to enhance TE performance monitoring capability. This monitoring capability will facilitate proactive re-optimization and reconfiguration of TEs based on the performance monitoring data collected via the TE KPI Telemetry YANG model.

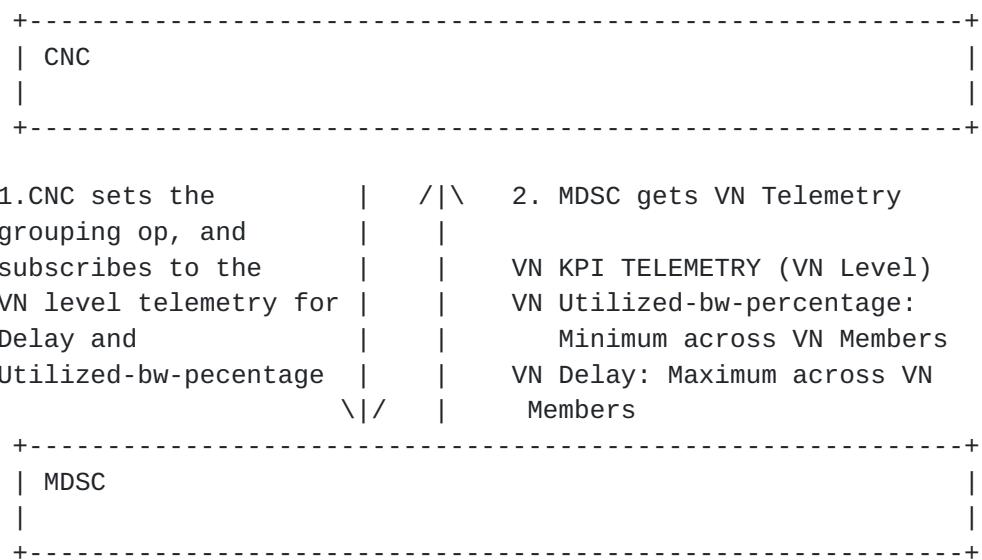

3.2. ACTN TE KPI Telemetry Model

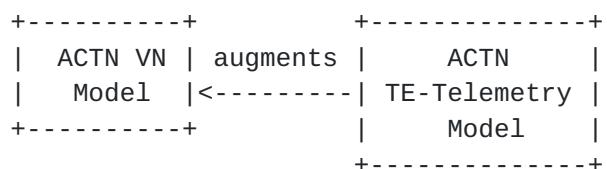

This module describes performance telemetry for ACTN VN model. The telemetry data is augmented both at the VN Level as well as individual VN member level. This module also allows autonomic traffic engineering scaling intent configuration mechanism on the VN

level. Scale in/out criteria might be used for network autonomies in order the controller to react to a certain set of variations in monitored parameters.

Moreover, this module also provides mechanism to define aggregated telemetry parameters as a grouping of underlying VN level telemetry parameters. Grouping operation (such as maximum, mean) could be set at the time of configuration. For example, if maximum grouping operation is used for delay at the VN level, the VN telemetry data is reported as the maximum {delay_vn_member_1, delay_vn_member_2, ..., delay_vn_member_N}. Thus, this telemetry abstraction mechanism allows the grouping of a certain common set of telemetry values under a grouping operation. This can be done at the VN-member level to suggest how the E2E telemetry be inferred from the per domain tunnel created and monitored by PNCS. One proposed example is the following:

The ACTN VN TE-Telemetry Model augments the basic ACTN VN model to enhance VN monitoring capability. This monitoring capability will facilitate proactive re-optimization and reconfiguration of VNs based on the performance monitoring data collected via the ACTN VN Telemetry YANG model.

4. Notification

This model does not define specific notifications. To enable notifications, the mechanism defined in [I-D.ietf-netconf-yang-push] and [I-D.ietf-netconf-rfc5277bis] can be used. This mechanism currently allows the user to:

- . Subscribe notifications on a per client basis.
- . Specify subtree filters or xpath filters so that only interested contents will be sent.
- . Specify either periodic or on-demand notifications.

4.1. YANG Push Subscription Examples

Below example shows the way for a client to subscribe for the telemetry information for a particular tunnel (Tunnel1). The telemetry parameter that the client is interested in is the utilized bandwidth percentage.

```
<netconf:rpc netconf:message-id="101"
  xmlns:netconf="urn:ietf:params:xml:ns:netconf:base:1.0">
  <establish-subscription
    xmlns="urn:ietf:params:xml:yang:ietf-yang-push:1.0">
    <filter netconf:type="subtree">
      <te xmlns="urn:ietf:params:xml:ns:yang:ietf-te">
        <tunnels>
          <tunnel>
            <name>Tunnel1</name>
            <identifier/>
            <state>
              <te-telemetry
                xmlns="urn:ietf:params:xml:ns:yang:ietf-te-kpi-telemetry">
                <utilized-
percentage/>

              </te-telemetry>
            </state>
          </tunnel>
        </tunnels>
      </te>
    </filter>
  </establish-subscription>
</netconf:rpc>
```

```

        </tunnels>
    </te>
</filter>
<period>500</period>
<encoding>encode-xml</encoding>
</establish-subscription>
</netconf:rpc>
```

This example shows the way for a client to subscribe for the telemetry information for all VNs. The telemetry parameter that the client is interested in is one-way delay and utilized bandwidth percentage.

```

<netconf:rpc netconf:message-id="101"
  xmlns:netconf="urn:ietf:params:xml:ns:netconf:base:1.0">
<establish-subscription
  xmlns="urn:ietf:params:xml:yang:ietf-yang-push:1.0">
  <filter netconf:type="subtree">
    <actn-state xmlns="urn:ietf:params:xml:ns:yang:ietf-actn-
vn">
      <vn>
        <vn-list>
          <vn-id/>
          <vn-name/>
          <vn-
telemetry xmlns="urn:ietf:params:xml:ns:yang:ietf-actn-te-kpi-
telemetry">
            <one-way-delay/>
            <utilized-
percentage/>
            </vn-telemetry >
          </vn-list>
        </vn>
      </actn-state>
    </filter>
    <period>500</period>
  </establish-subscription>
</netconf:rpc>
```

<CODE ENDS>

7. Security Considerations

The configuration, state, and action data defined in this document are designed to be accessed via a management protocol with a secure transport layer, such as NETCONF [[RFC6241](#)]. The NETCONF access control model [[RFC6536](#)] provides the means to restrict access for particular NETCONF users to a preconfigured subset of all available NETCONF protocol operations and content.

A number of configuration data nodes defined in this document are writable/deletable (i.e., "config true") These data nodes may be considered sensitive or vulnerable in some network environments.

8. IANA Considerations
