YANG Data Model for Automatic Multicast Tunneling
draft-liu-mboned-amt-yang-02

Abstract

This document defines YANG data models for the configuration and management of Automatic Multicast Tunneling (AMT) protocol operations.

Status of this Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on August 3, 2023.

[1. Introduction](#)

[RFC7450] introduces the protocol definition of the Automatic Multicast Tunneling (AMT) for delivering multicast traffic from sources in a multicast-enabled network to receivers that lack multicast connectivity to the source network. The protocol uses UDP encapsulation and unicast replication to provide this functionality.

[RFC8777] updates [RFC7450] by modifying the relay discovery process. It defines DNS Reverse IP AMT Discovery (DRIAD) mechanism for AMT gateways to discover AMT relays that are capable of forwarding multicast traffic from a known source IP address.

This document defines YANG data models for configuring and managing AMT Protocol.

[1.1. Terminology](#)

The terminology for describing YANG data models is found in [RFC6020] and [RFC7950], including:

- o augment
- o data model

- o data node
- o identity
- o module

The following abbreviations are used in this document and the defined model:

AMT: Automatic Multicast Tunneling [[RFC7450](#)].

1.2. Conventions Used in This Document

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [BCP 14](#) [[RFC2119](#)] [[RFC8174](#)] when, and only when, they appear in all capitals, as shown here.

1.3. Tree Diagrams

Tree diagrams used in this document follow the notation defined in [[RFC8340](#)].

1.4. Prefixes in Data Node Names

In this document, names of data nodes, actions, and other data model objects are often used without a prefix, as long as it is clear from the context in which YANG module each name is defined. Otherwise, names are prefixed using the standard prefix associated with the corresponding YANG module, as shown in Table 1.

Prefix	YANG module	Reference
inet	ietf-inet-types	[RFC6991]
rt-types	ietf-routing-types	[RFC8294]

rt	ietf-routing	[RFC8349]	
yang	ietf-yang-types	[RFC6991]	
if	ietf-interfaces	[RFC8343]	

Table 1

[2. Model Overview](#)

AMT YANG data models are defined in this document.

The `ietf-amt.yang` data model provides the methods for configuring and managing AMT Protocol. It includes:

- o Parameters of AMT Relay service, such as Relay Discovery Address, Relay Address, service switch, the maximum number of tunnels and secret key timeout.
- o Parameters of AMT gateway service, such as Relay Discovery Address, Relay Address, Discovery Timeout, Request Timeout and Maximum Retransmission Count.
- o AMT tunnel information, such as endpoint address and UDP port, local address and UDP port.
- o DNS resource record used by AMTRELAY.

[3. AMT YANG Module](#)

[3.1. Tree View](#)

The complete tree of the `ietf-amt.yang` data model is represented as following. See [[RFC8340](#)] for an explanation of the symbols used.

This model augments the core routing data model "ietf-routing" specified in [[RFC8349](#)]. The AMT model augments "/rt:routing/rt:control-plane-protocols".
