Guidelines for Translation of UML Information Model to YANG Data Model
draft-mansfield-netmod-uml-to-yang-00

Abstract

This document defines guidelines for translation of data modeled with UML to YANG including mapping of object classes, attributes, data types, associations, interfaces, operations and operation parameters, notifications, and lifecycle.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on January 4, 2016.

------------------------------	--------------------

1. Introduction

As discussed in [draft-lam-teas-usage-info-model-net-topology](#) [5] a Data Model (DM) may be derived from an Information Model (IM). However, in order to assure a consistent and valid data modelling language representation that enables maximum interoperability, translation guidelines are required. A set of translation rules also assists in development of automated tooling.

This draft defines guidelines for translation of data modelled with UML [6] (as constrained by the ONF's UML Modeling Guidelines [7]) to YANG (defined in [RFC6020](#) [2] and YANG Update [3]) including mapping of object classes, attributes, data types, associations, interfaces, operations and operation parameters, notifications, and lifecycle.

2. Keywords

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC 2119](#) [1].

3. Terminology

The following terms are defined in [RFC6020](#) [2]

- o anydata
- o anyxml
- o augment
- o container
- o data node
- o identity
- o instance identifier
- o leaf
- o leaf-list
- o list
- o module

- o submodule

The following terms are defined in UML 2.4 [6]

- o association
- o attribute
- o data type
- o interface
- o object class
- o operation
- o parameter
- o signal (used to model notifications)

4. Overview

This document defines translation rules for all constructs used in a UML based IM to a data model using YANG.

While some mapping rules are straightforward, an IM in UML uses some constructs that cannot be mapped directly to a DM using YANG and conventions are described to make the translation predictable. Additionally, in some cases multiple mapping approaches are possible and selection among these is also necessary to assure interoperability.

Mapping guidelines for these constructs are provided in the following sections.

5. Mapping Guidelines

5.1. Mapping Guideline Considerations

Where "??" is inserted in the table, it means that the specific mapping is for further study as it is either as yet unclear how to map the construct or that there are multiple ways of doing the mapping and a single one needs to be selected.

A table will be included summarizing constructs in UML that do not directly map to YANG and where in this draft the associated guidelines for mapping these constructs will be provided.

5.2. Mapping of Object Classes

+-----+ Object Class --> "list" statement (key property) or "container" statement +-----+			
UML Artifact	YANG Artifact	Comment	
+-----+			
documentation	"description"		
	substatement		
+-----+			
superclass(es)	??		
+-----+			
abstract	abstract: "container"		
	not abstract: "list"		
+-----+			
objectCreationNotific-	??		
ation			
+-----+			
objectDeletionNotific-	??		
ation			
+-----+			
support	"if-feature"		
	substatement		
+-----+			
condition	"if-feature"		
	substatement		
+-----+			
operation	"action"		
	substatement		
+-----+			
XOR	"choice"		
	substatement		
+-----+			
??	"config"		
	substatement		
+-----+			
error notification?	"must"		
	substatement		
+-----+			
object identifier	list::"key"		
	substatement		
+-----+			
??	list::"min-elements"	min-elements	
	"max-elements"	default = 0	
	substatements	max-elements	
		default=unbounded	
		mandatory	

		default=false	
Conditional PACs	container::presence"		
	substatement		
hyperlink?	"reference"	Papyrus doesn't	
	substatement	support hyperlinks	
lifecycle stereotypes	"status"	"current"	
	substatement	"deprecated"	
		"obsolete"	
		default="current"	
??	list::"unique"		
	substatement		
complex attribute	"uses" substatement		
{<constraint>}	"when" substatement		

Figure 1: Mapping of Object Classes

5.3. Mapping of Attributes

Attribute --> "leaf" (single) or "leaf list" (multiple)			
statement			
UML Artifact	YANG Artifact	Comment	
documentation	"description"		
	substatement		
type	"type" substatement		
	(built-in or derived)		
readOnly	"config" substatement		
	(false)		
isOrdered	"ordered-by"		
	substatement		
	("system" or "user")		
multiplicity	"min-elements" and	min-elements	
	"max-elements"	default = 0	
	substatements	max-elements	
	[0..x]=>mandatory	default=unbounded	

	substatement=false [1..x]=>mandatory substatement=true	mandatory default=false
defaultValue	"default" substatement	If a default value exists and it is the desired value, the parameter does not have to be explicitly configured by the user.
isInvariant	"config" substatement (false)	
valueRange	"range" or "length" substatement of "type" substatement	
passedById	??	
support	"if-feature" substatement	
condition	"if-feature" substatement	
error notification?	"must" substatement	
hyperlink?	"reference" substatement	Papyrus doesn't support hyperlinks
lifecycle stereotypes	"status" substatement	"current" "deprecated" "obsolete" default="current"
unit?	"units" substatement	
{<constraint>}	"when" substatement	

Figure 2: Mapping of Attributes

5.4. Mapping of Types

UML Artifact	YANG Artifact	Comment
Primitive Type	??	new built-in type?
Enumeration	"enum" statement	
Basic Data Type	"typeDef" statement	
Complex Data Type	"grouping" statement	

Figure 3: Mapping of Types

Note: YANG allows also in-line enumerations which are not possible in UML

5.4.1. Mapping of Primitive Types

Primitive Type -> new built-in type?		
UML Artifact	YANG Artifact	Comment
documentation	??

Package	Submodule		
+-----+			

Figure 15: Other Mappings

6. Mapping Issues

When translating from UML information models to YANG data models some mapping rules are straightforward, and some are not. This section provides considerations and recommendations for the more complex translations.

6.1. Mapping of Recursion

- o Statically define a number of recursion levels
- o Reference Based Approach

In the static approach, some number of recursion levels is pre-configured. In the Reference-based approach, a flat list is maintained using hierarchical identities. The reference-based approach is generally preferred because there is no arbitrary limitation set in the solution.

7. Mapping Patterns

7.1. UML Recursion

TBD

7.2. UML Conditional Pacs

May use the "presence" property of the container statement?

Figure 16: Mapping of Conditional Packages (Available in PDF or HTML versions)

7.3. XOR Relationship

Use the "choice" property of the container statement.

8. Mapping Basics

8.1. UML-YANG or XMI-YANG

Figure 17: Example UML to YANG Mapping (Available in PDF or HTML versions)

Figure 18: Example XMI (Papyrus) to YANG Mapping (Available in PDF or HTML versions)

8.2. XMI Differences

Figure 19: Example XMI (Papyrus) / XMI (RSA) Differences (Available in PDF or HTML versions)

Figure 20: Example XMI (Papyrus) / XMI (RSA) Differences (detailed) (Available in PDF or HTML versions)

10. IANA Considerations

This memo includes no request to IANA.

11. Security Considerations

This document defines defines guidelines for translation of data modeled with UML to YANG. As such, it doesn't contribute any new security issues beyond those discussed in Sec. 16 of [RFC6020](#) [2].
