Two-Way Active Measurement Protocol (TWAMP) Light Data Model
draft-mirsky-ippm-twamp-light-yang-09

Abstract

This document specifies the data model for implementations of Session-Sender and Session-Reflector for Two-Way Active Measurement Protocol (TWAMP) Light mode using YANG.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on December 15, 2017.

[1. Introduction](#)

The Two-Way Active Measurement Protocol (TWAMP) [[RFC5357](#)] can be used to measure performance parameters of IP networks such as latency, jitter, and packet loss by sending test packets and monitoring their experience in the network. The [[RFC5357](#)] defines two protocols, TWAMP Control and TWAMP Test, and a profile of TWAMP Test, TWAMP Light. The TWAMP Light is known to have many implementations though no common management framework being defined, thus leaving some aspects of test packet processing to interpretation. The goal of this document is to collect analyze these variations; describe common model while allowing for extensions in the future. This document defines such a TWAMP data model and specifies it formally using the YANG data modeling language [[RFC6020](#)].

[1.1. Conventions used in this document](#)

[1.1.1. Requirements Language](#)

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [BCP 14](#) [[RFC2119](#)] [[RFC8174](#)] when, and only when, they appear in all capitals, as shown here.

[Page 2]

2. Scope, Model, and Applicability

The scope of this document includes model of the TWAMP Light as defined in [Appendix I of \[RFC5357\]](#). This mode of TWAMP Light will be referred in this document as Stateless. Another mode, where the Session-Reflector is aware of the state of the TWAMP test session and thus can independently count reflected test packets, referred as Stateful. This document benefits from earlier attempt to define TWAMP MIB in [[I-D_elteto-ippm-twamp-mib](#)] and from TWAMP YANG model defined in [[I-D_ietf-ippm-twamp-yang](#)].

Figure 1 updates TWAMP-Light reference model presented in [Appendix I \[RFC5357\]](#) for the scenario when instantiation of a TWAMP-Test session between Session-Sender and Session-Reflector controlled by communication between a Configuration Client as a manager and Configuration Servers as agents of the configuration session.

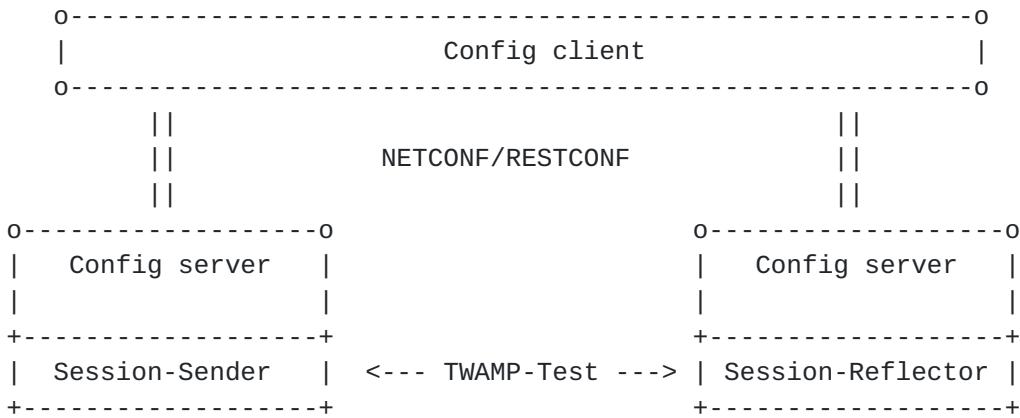

Figure 1: TWAMP Light Reference Model

2.1. Data Model Parameters

This section describes all the parameters of the the TWAMP-Light data model.

2.1.1. Session-Sender

The `twamp-light-session-sender` container holds items that are related to the configuration of the TWAMP-Light Session-Sender logical entity.

The `twamp-light-session-sender-state` container holds information about the state of the particular TWAMP-Light test session.

Mirsky, et al.

Expires December 15, 2017

[Page 3]

RPCs `twamp-sender-start` and `twamp-sender-stop` respectively start and stop the referenced by session-id TWAMP-Light test session.

2.1.1.1. Controls for Test Session and Performance Metric Calculation

The data model supports several scenarios for Session-Sender to execute test sessions and calculate performance metrics:

The test mode in which the test packets are sent unbound in time at defined by the parameter '`interval`' in the `twamp-light-session-sender` container frequency is referred as continuous mode.

Performance metrics in the continuous mode are calculated at period defined by the parameter '`measurement-interval`'.

The test mode that has specific number of the test packets configured for the test session in the '`number-of-packets`' parameter is referred as periodic mode. The test session may be repeated by the Session-Sender with the same parameters. The '`repeat`' parameter defines number of tests and the '`repeat-interval`' - the interval between the consecutive tests. The performance metrics are calculated after each test session when the interval defined by the '`session-timeout`' expires.

2.1.2. Session-Reflector

The `twamp-light-session-reflector` container holds items that are related to the configuration of the TWAMP-Light Session-Reflector logical entity.

The `twamp-light-session-refl-state` container holds Session-Reflector state data for the particular TWAMP-Light test session.

3. Data Model

Creating TWAMP-Light data model presents number of challenges and among them is identification of a test-session at Session-Reflector. A Session-Reflector MAY require only as little as its IP and UDP port number in received TWAMP-Test packet to spawn new test session. More so, to test processing of Class-of-Service along the same route in Equal Cost Multi-Path environment Session-Sender may run TWAMP test sessions concurrently using the same source IP address, source UDP port number, destination IP address, and destination UDP port number. Thus the only parameter that can be used to differentiate these test sessions would be DSCP value. The DSCP field may get re-marked along the path and without use of [[RFC7750](#)] that will go undetected, but by using five-tuple instead of four-tuple as a key we can ensure that TWAMP test packets that are considered as different test sessions follow the same path even in ECMP environments.

<CODE ENDS>

4. IANA Considerations

This document registers a URI in the IETF XML registry [[RFC3688](#)]. Following the format in [[RFC3688](#)], the following registration is requested to be made.

URI: urn:ietf:params:xml:ns:yang:ietf-twamp-light

Registrant Contact: The IPPM WG of the IETF.

XML: N/A, the requested URI is an XML namespace.

This document registers a YANG module in the YANG Module Names registry [[RFC6020](#)].

name: ietf-twamp-light

namespace: urn:ietf:params:xml:ns:yang:ietf-twamp-light

prefix: twamp

reference: RFC XXXX

5. Security Considerations

The configuration, state, action data defined in this document may be accessed via the NETCONF protocol [[RFC6241](#)]. SSH [[RFC6242](#)] is mandatory secure transport that is the lowest NETCONF layer. The NETCONF access control model [[RFC6536](#)] provides means to restrict access for particular NETCONF users to a pre-configured subset of all available NETCONF protocol operations and content.

But, in general, this TWAMP Light YANG module does not change any underlying security issues that already may exist in [[I-D.elteto-ippm-twamp-mib](#)].
