Abstract

This document is the specification of the syntax and semantics of the Uniform Resource Identifier (URI) scheme for the Session Traversal Utilities for NAT (STUN) protocol.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at http://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on March 01, 2014.

This document specifies the syntax and semantics of the Uniform Resource Identifier (URI) scheme for the Session Traversal Utilities for NAT (STUN) protocol.

STUN is a protocol that serves as a tool for other protocols in dealing with Network Address Translator (NAT) traversal. It can be used by an endpoint to determine the IP address and port allocated to it by a NAT, to perform connectivity checks between two endpoints, and used as a keepalive protocol to maintain NAT bindings. RFC 5389 [RFC5389] defines the specifics of the STUN protocol.
The "stun" and "stuns" URI schemes are used to designate a standalone
STUN server or any Internet host performing the operations of a STUN
server in the context of STUN usages (Section 14 RFC 5389 [RFC5389]).
With the advent of standards such as WEBRTC [WEBRTC], we anticipate a
plethora of endpoints and web applications to be able to identify and
communicate with such a STUN server to carry out the STUN protocol.
This also implies those endpoints and/or applications to be
provisioned with appropriate configuration required to identify the
STUN server. Having an inconsistent syntax has its drawbacks and can
result in non-interoperable solutions. It can result in solutions
that are ambiguous and have implementation limitations on the
different aspects of the syntax and alike. The 'stun/stuns' URI
scheme helps alleviate most of these issues by providing a consistent
way to describe, configure and exchange the information identifying a
STUN server. This would also prevent the shortcomings inherent with
encoding similar information in non-uniform syntaxes such as the ones
proposed in the WEBRTC Standards [WEBRTC], for example.

2. Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "MAY", and "OPTIONAL"
in this document are to be interpreted as described in [RFC2119] when
they appear in ALL CAPS. When these words are not in ALL CAPS (such as "should" or "Should"), they have their usual english meanings, and
are not to be interpreted as RFC 2119 key words.

3. Definition of the STUN or STUNS URI

3.1. URI Scheme Syntax

A STUN/STUNS URI has the following formal ABNF syntax [RFC5234]:

stunURI       = scheme ":" stun-host [ "." stun-port ]
scheme       = "stun" / "stuns"
stun-host     = IP-literal / IPv4address / reg-name
stun-port     = *DIGIT
IP-literal    = "[" ( IPv6address / IPvFuture ) "]"
IPvFuture     = "v" 1*HEXDIG "." 1* ( unreserved / sub-delims / ":" )
IPv6address   = 6( h16 ":" ) ls32
                / "::" 5( h16 ":" ) ls32
                / [ h16 ] ":" 4( h16 ":" ) ls32
                / [ *1( h16 ":" ) h16 ] ":" 3( h16 ":" ) ls32
                / [ *2( h16 ":" ) h16 ] ":" 2( h16 ":" ) ls32
                / [ *3( h16 ":" ) h16 ] ":" 1( h16 ":" ) ls32
                / [ *4( h16 ":" ) h16 ] ":" 1( h16 ) ls32
                / [ *5( h16 ":" ) h16 ] ":" h16
                / [ *6( h16 ":" ) h16 ] ":"
h16           = 1*4HEXDIG
<unreserved>, <pct-encoded>, and <sub-delims> are specified in [RFC3986]. The core rules <DIGIT> and <HEXDIGIT> are used as described in Appendix B of RFC 5234 [RFC5234].

3.2. URI Scheme Semantics

The STUN protocol supports sending messages over UDP, TCP or TLS-over-TCP. The "stuns" URI scheme MUST be used when STUN is run over TLS-over-TCP (or in the future DTLS-over-UDP) and the "stun" scheme MUST be used otherwise.

The required <stun-host> part of the "stun" URI denotes the STUN server host.

For the optional DNS Discovery procedure mentioned in the Section 9 of RFC5389, "stun" URI scheme implies UDP as the transport protocol for SRV lookup and "stuns" URI scheme indicates TCP as the transport protocol.

As specified in [RFC5389], the <stun-port> part, if present, denotes the port on which the STUN server is awaiting connection requests. If it is absent, the default port is 3478 for both UDP and TCP. The default port for STUN over TLS is 5349 as per Section 9 of [RFC5389].

4. Implementation Status

Note to RFC Editor: Please remove this section and the reference to [RFC6982] before publication.

This section records the status of known implementations of the protocol defined by this specification at the time of posting of this Internet-Draft, and is based on a proposal described in [RFC6982]. The description of implementations in this section is intended to assist the IETF in its decision processes in progressing drafts to RFCs. Please note that the listing of any individual implementation here does not imply endorsement by the IETF. Furthermore, no effort has been spent to verify the information presented here that was supplied by IETF contributors. This is not intended as, and must not
be construed to be, a catalog of available implementations or their features. Readers are advised to note that other implementations may exist.

According to [RFC6982], "this will allow reviewers and working groups to assign due consideration to documents that have the benefit of running code, which may serve as evidence of valuable experimentation and feedback that have made the implemented protocols more mature. It is up to the individual working groups to use this information as they see fit".

4.1. libjingle

Organization:   Google Inc.

Name:   libjingle 0.7.1 https://code.google.com/p/chromium/
codesearch#chromium/src/third_party/libjingle/source/talk/app/
webrtc/peerconnection.cc

Description:   Libjingle is a set of components provided by Google to implement Jingle protocols XEP-166 (http://xmpp.org/extensions/
xep-0166.html) and XEP-167 (http://xmpp.org/extensions/
xep-0167.html).

Level of maturity:   Beta.

Licensing:   BSD 3-clauses license.

Contact:   https://code.google.com/p/chromium/

URL:   https://code.google.com/p/chromium/codesearch#chromium/src/third_party/libjingle/source/talk/app/webrtc/peerconnection.cc

4.2. Firefox

Organization:   Mozilla

Name:   Firefox Aurora 21 http://hg.mozilla.org/mozilla-central/rev/
6b5016ab9ebb

Description:   Mozilla Firefox is a free and open source web browser.

Level of maturity:   Beta.

Coverage:   Implements draft-nandakumar-rtcweb-stun-uri-03.
5. Security Considerations

The "stun" and "stuns" URI schemes do not introduce any specific security issues beyond the security considerations discussed in [RFC3986].

6. IANA Considerations

This section contains the registration information for the "stun" and "stuns" URI Schemes (in accordance with [RFC4395]). Note that these URI schemes are intended for use in very specific NAT traversal environments, and should not be used otherwise on the open Web or Internet.

6.1. STUN URI Registration

URI scheme name: stun

Status: permanent

URI scheme syntax: See Section 3.1.

URI scheme semantics: See Section 3.2.

Encoding considerations: There are no encoding considerations beyond those in [RFC3986].

Applications/protocols that use this URI scheme name:

The "stun" URI scheme is intended to be used by applications that might need access to a STUN server.

Interoperability considerations: N/A

Security considerations: See Section 5.

Contact: Suhas Nandakumar <snandaku@cisco.com>

Author/Change controller: The IESG

References: RFCXXXX
6.2. STUNS URI Registration

URI scheme name: stuns

Status: permanent

URI scheme syntax: See Section 3.1.

URI scheme semantics: See Section 3.2.

Encoding considerations: There are no encoding considerations beyond those in RFC3986.

Applications/protocols that use this URI scheme name:

The "stuns" URI scheme is intended to be used by applications that might need access to a STUN server over a secure connection.

Interoperability considerations: N/A

Security considerations: See Section 5.

Contact: Suhas Nandakumar <snandaku@cisco.com>

Author/Change controller: The IESG

References: RFCXXX;

7. Acknowledgements

The authors would like to extend a very special thanks to Cullen Jennings for bringing to our attention the WebRTC need for this document, as well as his detailed review and thoughtful comments on this document.

This document has benefitted from extensive discussion and review of many of the members of the RTCWEB and BEHAVE working groups. The authors would also like to acknowledge Ted Hardie, Bjoern Hoehrmann, Russ Housley, Subramanian Moonesamy, Hadriel Kaplan, Graham Klyne, Peter Saint-Andre and Harald Alvestrand for their invaluable input, reviews, feedback comments, and suggestions that helped to improve this document.
The authors would also like to express their gratitude to Dan Wing for his assistance in shepherding this document. We also want to thank Gonzalo Camarillo, the Real-time Applications and Infrastructure Director, for sponsoring this document as well his careful reviews.

This document was written with the xml2rfc tool described in [RFC2629].

8. References

8.1. Normative References

8.2. Informative References

Appendix A. Examples
Table 1 shows examples for 'stun/stuns:uri scheme. For all these examples, the <host> component is populated with "example.org".

<table>
<thead>
<tr>
<th>URI</th>
</tr>
</thead>
<tbody>
<tr>
<td>stun:example.org</td>
</tr>
<tr>
<td>stuns:example.org</td>
</tr>
<tr>
<td>stun:example.org:8000</td>
</tr>
</tbody>
</table>

Table 1

Appendix B. Design Notes

- The ABNF in this document duplicates the <IP-literal>, <IPv4address>, and <reg-name> productions and other dependent productions from [RFC3986], instead of referencing them. This is because the definitions in [RFC3986] are for hierarchical URIs, so using these references in an opaque URI made reviewers think that a hierarchical URI parser could be used to parse the URIs defined in this document.

- One recurring comment was to stop using the suffix "s" on URI scheme, and to move the secure option to a parameter (e.g., ";proto=tlss"). We decided against this idea because the need for ";proto=" for the STUN URI cannot be sufficiently explained and supporting it would render an incomplete specification. This would also result in lost symmetry between the TURN and STUN URIs. A more detailed account of the reasoning behind this is available at <http://blog.marc.petit-huguenin.org/2012/09/on-design-of-stun-and-turn-uri-formats.html>

- Following the advice of Section 2.2 of [RFC4395], and because the STUN URI does not describe a hierarchical structure, the STUN URIs are opaque.

Appendix C. Release notes

NOTE TO RFC EDITOR: This section must be removed before publication as an RFC.
C.1. Modifications between draft-nandakumar-rtcweb-stun-uri-06 and draft-nandakumar-rtcweb-stun-uri-05

- Removed the <IP-literal>, <IPv4address>, and <reg-name> ABNF productions and other dependant productions, added references to RFC 3986, and modified the design note to warn developers against using a hierarchical URI parser.

- Updated the normative reference for RFC 6982, refreshed the boilerplate, moved the download links into the name item.

- Added an annotation to the scheme registration indicating the appropriate usage scope for the stun/stuns URI schemes.

- Added clarification that RFC 5389 are the references for finding the default port.

- Cleaned up the Acknowledgements text.

- Added an additional Design Note regarding the opaque nature of STUN URIs.
