**Traversal Using Relays around NAT (TURN) Uniform Resource Identifiers  
draft-petithuguenin-behave-turn-uris-03**

**Abstract**

This document specifies the syntax of Uniform Resource Identifier (URI) schemes for the Traversal Using Relays around NAT (TURN) protocol. It defines two URI schemes that can be used to provision the configuration values needed by the resolution mechanism defined in [[RFC5928](#)].

**Status of this Memo**

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#). This document may not be modified, and derivative works of it may not be created, except to format it for publication as an RFC or to translate it into languages other than English.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on July 20, 2013.

## 1. Introduction

This document specifies the syntax and semantics of the Uniform Resource Identifier (URI) scheme for the Traversal Using Relays around NAT (TURN) protocol.

The TURN protocol is a specification allowing hosts behind NAT to control the operation of a relay server. The relay server allows hosts to exchange packets with its peers. The peers themselves may also be behind NATs. [RFC 5766](#) [[RFC5766](#)] defines the specifics of the TURN protocol.

The "turn" and "turns" URI schemes are used to designate a TURN server (also known as a relay) on Internet hosts accessible using the TURN protocol. With the advent of standards such as [[WEBRTC](#)], we anticipate a plethora of endpoints and web applications to be able to identify and communicate with such a TURN server to carry out the TURN protocol. This also implies those endpoints and/or applications to be provisioned with appropriate configuration required to identify the TURN server. Having an inconsistent syntax has its drawbacks and can result in non-interoperable solutions. It can result in solutions that are ambiguous and have implementation limitations on the different aspects of the syntax and alike. The "turn/turns" URI scheme helps alleviate most of these issues by providing a consistent way to describe, configure and exchange the information identifying a TURN server. This would also prevent the shortcomings inherent with encoding similar information in non-uniform syntaxes such as the ones proposed in [[WEBRTC](#)], for example.

[[RFC5928](#)] defines a resolution mechanism to convert a secure flag, a host name or IP address, an eventually empty port, and an eventually empty transport to a list of IP address, port, and TURN transport tuples.

To simplify the provisioning of TURN clients, this document defines a TURN and a TURNS URI scheme that can carry the four components needed for the resolution mechanism.

A reference implementation [[REF-IMPL](#)] is available.

## 2. Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [[RFC2119](#)].

### 3. Definitions of the TURN and TURNS URI

#### 3.1. URI Scheme Syntax

The "turn" URI takes the following form (the syntax below is non-normative):

```
turn:<host>:<port>
turns:<host>:<port>
```

Note that the <port> part and the preceding ":" (colon) character, is OPTIONAL.

A TURN/TURNS URI has the following formal ABNF syntax [[RFC5234](#)]:

```
turnURI      = scheme ":" turn-host [ ":" turn-port ]
               [ "?transport=" transport ]
scheme        = "turn" / "turns"
transport     = "udp" / "tcp" / transport-ext
transport-ext = 1*unreserved
turn-host     = IP-literal / IPv4address / reg-name
turn-port     = *DIGIT
IP-literal    = "[" ( IPv6address / IPvFuture  ) "]"
IPvFuture     = "v" 1*HEXDIG "." 1*( unreserved / sub-delims / ":" )
IPv6address   =
    6( h16 ":" ) ls32
    /
    "::" 5( h16 ":" ) ls32
    / [
        h16 ] "::" 4( h16 ":" ) ls32
    / [ *1( h16 ":" ) h16 ] "::" 3( h16 ":" ) ls32
    / [ *2( h16 ":" ) h16 ] "::" 2( h16 ":" ) ls32
    / [ *3( h16 ":" ) h16 ] "::"   h16 ":"   ls32
    / [ *4( h16 ":" ) h16 ] "::"                        ls32
    / [ *5( h16 ":" ) h16 ] "::"                        h16
    / [ *6( h16 ":" ) h16 ] "::"
h16           = 1*4HEXDIG
ls32          = ( h16 ":" h16 ) / IPv4address
IPv4address   = dec-octet "." dec-octet "." dec-octet "." dec-octet
dec-octet     = DIGIT                     ; 0-9
               / %x31-39 DIGIT           ; 10-99
               / "1" 2DIGIT              ; 100-199
               / "2" %x30-34 DIGIT       ; 200-249
               / "25" %x30-35            ; 250-255
reg-name      = *( unreserved / pct-encoded / sub-delims )
```

<unreserved>, <sub-delims>, and <pct-encoded> are specified in [[RFC3986](#)]. The core rules <DIGIT> and <HEXDIGIT> are used as described in [Appendix B of RFC 5234](#) [[RFC5234](#)].

The <host>, <port> and <transport> components are passed without

modification to the [[RFC5928](#)] algorithm. <secure> is set to false if <scheme> is equal to "turn" and set to true if <scheme> is equal to "turns" and passed to the [[RFC5928](#)] algorithm with the other components.

### **[3.2.](#) URI Scheme Semantics**

The TURN protocol supports sending messages over UDP, TCP or TLS-over-TCP. The "turns" URI scheme MUST be used when TURN is run over TLS-over-TCP (or in the future DTLS-over-UDP) and the "turn" scheme MUST be used otherwise.

The required <host> part of the "turn" URI denotes the TURN server host.

The <port> part, if present, denotes the port on which the TURN server is awaiting connection requests. If it is absent, the default port is 3478 for both UDP and TCP. The default port for TURN over TLS is 5349.

## **[4.](#) Security Considerations**

Security considerations for the resolution mechanism are discussed in [[RFC5928](#)].

The "turn" and "turns" URI schemes do not introduce any specific security issues beyond the security considerations discussed in [[RFC3986](#)].

## **[5.](#) IANA Considerations**

This section contains the registration information for the "turn" and "turns" URI Schemes (in accordance with [[RFC4395](#)]).

### **[5.1.](#) TURN URI Registration**

URI scheme name: turn

Status: permanent

URI scheme syntax: See [Section 3.1](#).

URI scheme semantics: See [Section 3.2](#).

Encoding considerations: There are no encoding considerations beyond those in [[RFC3986](#)].

Applications/protocols that use this URI scheme name:

The "turn" URI scheme is intended to be used by applications that might need access to a TURN server.

Interoperability considerations: N/A

Security considerations: See [Section 4](#).

Contact: Marc Petit-Huguenin <petithug@acm.org>

Author/Change controller: The IESG

References: RFCXXXX

[[NOTE TO RFC EDITOR: Please change XXXX to the number assigned to this specification, and remove this paragraph on publication.]]

## **[5.2.](#) TURNS URI Registration**

URI scheme name: turns

Status: permanent

URI scheme syntax: See [Section 3.1](#).

URI scheme semantics: See [Section 3.2](#).

Encoding considerations: There are no encoding considerations beyond those in [\[RFC3986\]](#).

Applications/protocols that use this URI scheme name:

The "turns" URI scheme is intended to be used by applications that might need access to a TURN server over a secure connection.

Interoperability considerations: N/A

Security considerations: See [Section 4](#).

Contact: Marc Petit-Huguenin <petithug@acm.org>

Author/Change controller: The IESG

References: RFCXXXX

[[NOTE TO RFC EDITOR: Please change XXXX to the number assigned to this specification, and remove this paragraph on publication.]]

## **6. Acknowledgements**

Thanks to Margaret Wasserman, Magnus Westerlund, Juergen Schoenwaelder, Sean Turner, Ted Hardie, Dave Thaler, Alfred E. Heggstad, Eilon Yardeni, Dan Wing, Alfred Hoenes, and Jim Kleck for their comments, suggestions and questions that helped to improve the [draft-petithuguenin-behave-turn-uri-bis](#) document.

Many thanks to Cullen Jennings for his detailed review and thoughtful comments on the [draft-nandakumar-rtcweb-turn-uri](#) document.

Thanks to Bjoern Hoehrmann for his comments, suggestions and questions that helped to improve the this document.

The <turn-port> and <turn-host> ABNF productions have been copied from the <port> and <host> ABNF productions from [[RFC3986](#)].

## Appendix A. Examples

Table 1 shows how the <secure>, <port> and <transport> components are populated from various URIs. For all these examples, the <host> component is populated with "example.org".

URI	<secure>	<port>	<transport>
turn:example.org	false		
turns:example.org	true		
turn:example.org:8000	false	8000	
turn:example.org?transport=udp	false		UDP
turn:example.org?transport=tcp	false		TCP
turns:example.org?transport=tcp	true		TLS

Table 1

## Appendix B. Release notes

This section must be removed before publication as an RFC.

### B.1. Design Notes

- One recurring comment was to stop using the suffix "s" on URI scheme, and to move the secure option to a parameter (e.g. ";proto=tls"). We decided against this idea because the STUN URI does not have a ";proto=" parameter and we would have lost the symmetry between the TURN and STUN URIs. A more detailed account of the reasoning behind this is available at <http://blog.marc.petit-huguenin.org/2012/09/on-design-of-stun-and-turn-uri-formats.html>
- Following the advice of [RFC 4395 section 2.2.](#), and because the TURN URI does not describe a hierarchical structure, the TURN URIs are opaque URIs.

- o <password> is not used in the URIs because it is deprecated.  
<username> is not used in the URIs because it is not used to guide the resolution mechanism.
- o As discussed in Dublin, there is no generic parameters in the URI to prevent compatibility issues.

**B.2. Modifications between petithuguenin-behave-turn-uris-03 and petithuguenin-behave-turn-uris-02**

- o Changed affiliation.
- o Cleaned [RFC 2119](#) section.
- o Changed title [section 3](#).
- o Fixed reference URI scheme semantics in registrations.
- o s/SHALL/MUST/.
- o s/SHALL be/is/.
- o "turn/turns" URI scheme -> "turn" and "turns" URI schemes.
