Datagram Transport Layer Security (DTLS) as Transport for Session Traversal Utilities for NAT (STUN)
draft-petithuguenin-tram-stun-dtls-00

Abstract

   This document specifies the usage of Datagram Transport Layer
   Security (DTLS) as a transport protocol for Session Traversal
   Utilities for NAT (STUN). It provides guidances on when and how to
   use DTLS with the currently standardized STUN Usages. It also
   specifies modifications to the STUN URIs and TURN URIs and to the
   TURN resolution mechanism to facilitate the resolution of STUN URIs
   and TURN URIs into the IP address and port of STUN and TURN servers
   supporting DTLS as a transport protocol.

Status of This Memo

   This Internet-Draft is submitted in full conformance with the
   provisions of BCP 78 and BCP 79.

   Internet-Drafts are working documents of the Internet Engineering
   Task Force (IETF). Note that other groups may also distribute
   working documents as Internet-Drafts. The list of current Internet-
   Drafts is at http://datatracker.ietf.org/drafts/current/.

   Internet-Drafts are draft documents valid for a maximum of six months
   and may be updated, replaced, or obsoleted by other documents at any
   time. It is inappropriate to use Internet-Drafts as reference
   material or to cite them other than as "work in progress."

   This Internet-Draft will expire on August 15, 2014.

Table of Contents

1. Introduction

STUN [RFC5389] defines Transport Layer Security (TLS) over TCP
(simply referred to as TLS [RFC5246]) as the transport for STUN due
to additional security advantages it offers over plain UDP or TCP
transport. But TLS-over-TCP is not an optimal transport when STUN is
used for its originally intended purpose, which is to support
multimedia sessions. This sub-optimality primarily stems from the

added latency incurred by the TCP-based head-of-line (HOL) blocking
problem coupled with additional TLS buffering (for integrity checks).
This is a well documented and understood transport limitation for
secure real-time communications.

TLS-over-UDP (referred to as DTLS [RFC6347]) offers the same security
advantages as TLS-over-TCP, but without the undesirable latency
concerns.

2. Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "MAY", and "OPTIONAL"
in this document are to be interpreted as described in [RFC2119] when
they appear in ALL CAPS. When these words are not in ALL CAPS (such
as "must" or "Must"), they have their usual English meanings, and are
not to be interpreted as RFC 2119 key words.

3. DTLS as Transport for STUN

STUN [RFC5389] defines three transports: UDP, TCP, and TLS. This
document adds DTLS as a valid transport for STUN.

STUN over DTLS MUST use the same retransmission rules as STUN over
UDP (as described in Section 7.2.1 of [RFC5389]). It MUST also use
the same rules that are described in Section 7.2.2 of [RFC5389] to
verify the server identity. STUN over DTLS MUST, at a minimum,
support TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256 [[TODO: What is the
recommendation these days?]]. The same rules established in
Section 7.2.2 of [RFC5389] for keeping open and closing TCP/TLS
connections MUST be used as well for DTLS associations.

In addition to the path MTU rules described in Section 7.1 of
[RFC5389], if the path MTU is unknown, the actual STUN message needs
to be adjusted to take into account the size of the (13-byte) DTLS
Record header, the MAC size, the padding size and the eventual
compression applied to the payload.

By default, STUN over DTLS MUST use port 5349, the same port as STUN
over TLS. However, the SRV procedures can be implemented to use a
different port (as described in Section 9 of [RFC5389]). When using
SRV records, the service name MUST be set to "stuns" and the
application name to "udp".

Classic STUN [RFC3489] defines only UDP as a transport and DTLS MUST
NOT be used. Any STUN request or indication without the magic cookie
over DTLS MUST always result in an error. [[TODO: Note that it is a
departure from RFC 5389, which does not explicitly state what to do
in that case. Are we OK with this?]]

4. STUN Usages

[RFC5389] Section 7.2 states that STUN usages must specify which
transport protocol is used. The following sections discuss if and
how the existing STUN usages are used with DTLS as the transport.
Future STUN usages MUST take into account DTLS as a transport and
discuss its applicability. [[TODO: Note that Section 14 of RFC 5389
ommitted to say that transport applicability MUST be discussed. Is
this a reasonable addition?]].

4.1. NAT Discovery Usage

As stated by Section 13 of [RFC5389], "...TLS provides minimal
security benefits..." for this particular STUN usage. DTLS will also
similarly offer only limited benefit. This is because the only
mandatory attribute that is TLS/DTLS protected is the XOR-MAPPED-
ADDRESS, which is already known by an on-path attacker, since it is
the same as the source address and port of the STUN request. On the
other hand, using TLS/DTLS will prevent an active attacker to inject
XOR-MAPPED-ADDRESS in responses. The TLS/DTLS transport will also
protect the SOFTWARE attribute, which can be used to find
vulnerabilities in STUN implementations.

Regardless, this usage is rarely used by itself, since TURN [RFC5766]
is generally mandatory to use with ICE [RFC5245], and TURN provides
the same NAT Discovery feature as part of an Allocation creation. In
fact, with ICE, the NAT Discovery usage is only used when there is no
longer any resource available for new Allocations in the TURN server.

4.1.1. DTLS Support in STUN URIs

This document does not make any changes to the syntax of a STUN URI
[RFC7064]. As indicated in Section 3.2 of [RFC7064], secure
transports like STUN over TLS, and now STUN over DTLS, MUST use the
"stuns" URI scheme.

The <host> value MUST be used when using the rules in Section 7.2.2
of [RFC5389] to verify the server identity. [[TODO: What happens if
an IP address is used in the URI? Should we forbid that?]]

4.2. Connectivity Check Usage

Using DTLS would hide the USERNAME, PRIORITY, USE-CANDIDATE, ICE-
CONTROLLED and ICE-CONTROLLING attributes. But because MESSAGE-
INTEGRITY protects the entire STUN response using a password that is
known only by looking at the SDP exchanged, it is not possible for an
attacker to inject an incorrect XOR-MAPPED-ADDRESS, which would
subsequently be used as a peer reflexive candidate.

Adding DTLS on top of the connectivity check would delay, and consequently impair, the ICE process. There is, in fact, a proposal ([I-D.thomson-rtcweb-ice-dtls]) to use the DTLS handshake used by the WebRTC SRTP streams as a replacement for the connectivity checks, proving that adding additional round-trips to ICE is undesirable.

This usage MUST NOT be used with a STUN URI.

4.3. Media Keep-Alive Usage

The media keep-alive (described in Section 20 of [RFC5245]) runs inside an RTP or RTCP session, so it is already protected if the RTP or RTCP session is also protected (i.e., SRTP/SRTCP). Adding DTLS inside the SRTP/SRTCP session would add overhead, with minimal security benefit.

This usage MUST NOT be used with a STUN URI.

4.4. SIP Keep-Alive Usage

The SIP keep-alive (described in [RFC5626]) runs inside a SIP flow. This flow would be protected if a SIP over DTLS transport mechanism is implemented (such as described in [I-D.jennings-sip-dtls]).

This usage MUST NOT be used with a STUN URI.

4.5. NAT Behavior Discovery Usage

The NAT Behavior Discovery usage is Experimental and to date has never being effectively deployed. Despite this, using DTLS would add the same security properties as for the NAT Discovery Usage (Section 4.1).

The STUN URI can be used to access the NAT Discovery feature of a NAT Behavior Discovery server, but accessing the full features would require definition of a "stun-behaviors:" URI, which is out of scope for this document.

4.6. TURN Usage

TURN [RFC5766] defines three combinations of transports/allocations: UDP/UDP, TCP/UDP and TLS/UDP. This document adds DTLS/UDP as a valid combination. A TURN server using DTLS MUST implement the denial-of-service counter-measure described in Section 4.2.1 of [RFC6347].

[RFC6062] states that TCP allocations cannot be obtained using a UDP
association between client and server. The fact that DTLS uses UDP
implies that TCP allocations MUST NOT be obtained using a DTLS
association between client and server.

By default, TURN over DTLS uses port 5349, the same port as TURN over
TLS. However, the SRV procedures can be implemented to use a
different port (as described in Section 6 of [RFC5766]. When using
SRV records, the service name MUST be set to "turns" and the
application name to "udp".

4.6.1. DTLS Support in TURN URIs

This document does not make any changes to the syntax of a TURN URI
[RFC7065]. As indicated in Section 3 of [RFC7065], secure transports
like TURN over TLS, and now TURN over DTLS, MUST use the "turns" URI
scheme. When using the "turns" URI scheme to designate TURN over
DTLS, the transport value of the TURN URI, if set, MUST be "udp".

4.6.2 Resolution Mechanism for TURN over DTLS

This document defines a new Straightforward Naming Authority Pointer
(S-NAPTR) application protocol tag: "turn.dtls".

The <transport> component, as provisioned or resulting from the
parsing of a TURN URI, is passed without modification to the TURN
resolution mechanism defined in Section 3 of [RFC5928], but with the
following alterations to that algorithm:

o The acceptable values for transport name are extended with the
   addition of "dtls".

o The acceptable values in the ordered list of supported TURN
   transports is extended with the addition of "Datagram Transport
   Layer Security (DTLS)".

o The resolution algorithm ckeck rules list is extended with the
   addition of the following step:

       If <secure> is true and <transport> is defined as "udp" but the
       list of TURN transports supported by the application does not
       contain DTLS, then the resolution MUST stop with an error.

o The 5th rule of the resolution algorithm check rules list is
   modified to read like this:

       If <secure> is true and <transport> is not defined but the list
       of TURN transports supported by the application does not

contain TLS or DTLS, then the resolution MUST stop with an
error.

o   Table 1 is modified to add the following line:

```
+----------+-------------+----------------+
| <secure> | <transport> | TURN Transport |
+----------+-------------+----------------+
| true     | "udp"       | DTLS           |
+----------+-------------+----------------+
```

o   In step 1 of the resolution algorithm the default port for DTLS is
    5349.

o   In step 4 of the resolution algorithm the following is added to
    the list of conversions between the filtered list of TURN
    transports supported by the application and application protocol
    tags:

    "turn.dtls" is used if the TURN transport is DTLS.

Note that using the [RFC5928] resolution mechanism does not imply
that additional round trips to the DNS server will be needed (e.g.,
the TURN client will start immediately if the TURN URI contains an IP
address).

5. Implementation Status

[[Note to RFC Editor: Please remove this section and the reference to
[RFC6982] before publication.]]

This section records the status of known implementations of the
protocol defined by this specification at the time of posting of this
Internet-Draft, and is based on a proposal described in [RFC6982].
The description of implementations in this section is intended to
assist the IETF in its decision processes in progressing drafts to
RFCs. Please note that the listing of any individual implementation
here does not imply endorsement by the IETF. Furthermore, no effort
has been spent to verify the information presented here that was
supplied by IETF contributors. This is not intended as, and must not
be construed to be, a catalog of available implementations or their
features. Readers are advised to note that other implementations may
exist.

According to [RFC6982], "this will allow reviewers and working groups
to assign due consideration to documents that have the benefit of
running code, which may serve as evidence of valuable experimentation
and feedback that have made the implemented protocols more mature.

It is up to the individual working groups to use this information as
they see fit".

5.1. turnuri

Organization: Impedance Mismatch

Name: turnuri 0.5.0 http://debian.implementers.org/stable/source/
   turnuri.tar.gz

Description: A reference implementation of the URI and resolution
   mechanism defined in this document, RFC 7065 [RFC7065] and RFC
   5928 [RFC5928].

Level of maturity: Beta.

Coverage: Fully implements the URIs and resolution mechanism
   defined in this specification, in RFC 7065 and in RFC 5928.

Licensing: AGPL3

Implementation experience: TBD

Contact: Marc Petit-Huguenin <marc@petit-huguenin.org>.

5.2. rfc5766-turn-server

Organization: This is a public project, the full list of authors
   and contributors here: http://turnserver.open-sys.org/downloads/
   AUTHORS.

Name: http://code.google.com/p/rfc5766-turn-server/

Description: A mature open-source TURN server specs implementation
   (RFC 5766, RFC 6062, RFC 6156, etc) designed for high-performance
   applications, especially geared for WebRTC.

Level of maturity: Production level.

Coverage: Fully implements DTLS with TURN protocol.

Licensing: BSD: http://turnserver.open-sys.org/downloads/LICENSE

Implementation experience: DTLS is recommended for secure media
   applications. It has benefits of both UDP and TLS.

Contact: Oleg Moskalenko <mom040267@gmail.com>

6. Security Considerations

   STUN over DTLS as a STUN transport does not introduce any specific
   security considerations beyond those for STUN over TLS detailed in
   [RFC5389].

   The usage of "udp" as a transport parameter with the "stuns" URI
   scheme does not introduce any specific security issues beyond those
   discussed in [RFC7064].

   TURN over DTLS as a TURN transport does not introduce any specific
   security considerations beyond those for TURN over TLS detailed in
   [RFC5766].

   The usage of "udp" as a transport parameter with the "turns" URI
   scheme does not introduce any specific security issues beyond those
   discussed in [RFC7065].

   The new S-NAPTR application protocol tag defined in this document as
   well as the modifications this document makes to the TURN resolution
   mechanism described in [RFC5928] do not introduce any additional
   security considerations beyond those outlined in [RFC5928].

7. IANA Considerations

7.1. S-NAPTR application protocol tag

   This specification contains the registration information for one
   S-NAPTR application protocol tag (in accordance with [RFC3958]).

   Application Protocol Tag: turn.dtls

   Intended Usage: See Section 4.6.2

   Interoperability considerations: N/A

   Security considerations: See Section 6

   Relevant publications: This document

   Contact information: Marc Petit-Huguenin

   Author/Change controller: The IESG

7.2. Service Name and Transport Protocol Port Number

This specification contains the registration information for two
Service Name and Transport Protocol Port Numbers (in accordance with
[RFC6335]).

7.2.1. The stuns Service Name

Service Name: stuns

Transport Protocol(s):   UDP

Assignee: IESG

Contact: Marc Petit-Huguenin

Description: STUN over DTLS

Reference: This document

Port Number: 5349

7.2.2. The turns Service Name

Service Name: turns

Transport Protocol(s):   UDP

Assignee: IESG

Contact: Marc Petit-Huguenin

Description: TURN over DTLS

Reference: This document

Port Number: 5349

8. Acknowledgements

Thanks to Alan Johnston, Oleg Moskalenko, and Simon Perreault for the
comments, suggestions, and questions that helped improve this
document.

              in progress), October 2007.

Appendix A. Examples

   Table 1 shows how the <secure>, <port> and <transport> components are
   populated for a TURN URI that uses DTLS as its transport. For all
   these examples, the <host> component is populated with "example.net".

   +--------------------------------+----------+--------+-------------+
   | URI | <secure> | <port> | <transport> |
   +--------------------------------+----------+--------+-------------+
   | turns:example.net?transport=udp | true | | DTLS |
   +--------------------------------+----------+--------+-------------+

                                 Table 1

   With the DNS RRs in Figure 1 and an ordered TURN transport list of
   {DTLS, TLS, TCP, UDP}, the resolution algorithm will convert the TURN
   URI "turns:example.net" to the ordered list of IP address, port, and
   protocol tuples in Table 2.

```
   example.net.
   IN NAPTR 100 10 "" RELAY:turn.udp:turn.dtls "" datagram.example.net.
   IN NAPTR 200 10 "" RELAY:turn.tcp:turn.tls "" stream.example.net.

   datagram.example.net.
   IN NAPTR 100 10 S RELAY:turn.udp "" _turn._udp.example.net.
   IN NAPTR 100 10 S RELAY:turn.dtls "" _turns._udp.example.net.

   stream.example.net.
   IN NAPTR 100 10 S RELAY:turn.tcp "" _turn._tcp.example.net.
   IN NAPTR 200 10 A RELAY:turn.tls "" a.example.net.

   _turn._udp.example.net.
   IN SRV   0 0 3478 a.example.net.

   _turn._tcp.example.net.
   IN SRV   0 0 5000 a.example.net.

   _turns._udp.example.net.
   IN SRV   0 0 5349 a.example.net.

   a.example.net.
   IN A     192.0.2.1
```

                              Figure 1

```
                +-------+----------+------------+------+
                | Order | Protocol | IP address | Port |
                +-------+----------+------------+------+
                | 1     | DTLS     | 192.0.2.1  | 5349 |
                | 2     | TLS      | 192.0.2.1  | 5349 |
                +-------+----------+------------+------+
```

                              Table 2

Appendix B. Release notes

   This section must be removed before publication as an RFC.

B.1. Modifications between petithuguenin-tram-turn-dtls-00 and petithuguenin-tram-stun-dtls-00

   o Add RFC 6982 information for rfc5766-turn-server project.

   o Rename the draft as TURN is now just one of the usages.

   o Remove the references in the abstract to make idnits happy.

o No longer updates other standard drafts.

o Rewrite from a STUN over DTLS point of view. The previous text
   becomes section 4.6.

o Add IANA request for stuns port.

o Add acknowledgement section.
