**Parallel distributed information retrieval services  
draft-pradeepkumarxplorer-pdird-02**

**Abstract**

Have a way to know worldwide http accesses and bird eyes view of http traffic and topurls of the day and have distributed indexing

**Status of This Memo**

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on September 22, 2021.

Code Components extracted from this document must include Simplified BSD License text as described in [Section 4.e](#) of

the Trust Legal Provisions and are provided without warranty as described in the Simplified BSD License.

## **1. Introduction**

Parallel Distributed Information retrieval services  
Rudimentary idea first phase

I propose Parallel Distributed Information retrieval services where the index is

not with just one company like google or yahoo.

Each access of something results in being indexed or upgraded in rank to be retrieved.

So if someone access [dhyanyoga.info/Californian.html](http://dhyanyoga.info/Californian.html) it would be automatically indexed.

Right now if i am the author of the file i have to manually use some indexing software given by google or yahoo. I have not done it. Most websites google.com yahoo.com are not providing easy indexers as well.

So each Webserver would have a PDIRSD daemon or software in the website

If i access <https://goodspaguide.co.uk/features/balinese-massage-explained> then my webserver indexes it.

Each PDIRSD webserver would have also a indexer in the website

So if my website is walkonyourtoes.com it would have an indexer walkonyourtoes/indexer

So i am in Dalung and accessing a URL in canada it might be a transient file, so dalung would have some list of PDIRSD webserver, the nearest to my client browser would index the file or information in Canada that i accessed

So the WWW would have many PDIRSD servers and a search invocation from your desktop or smart fone screen would use some algorithm to search for some PDIRSD servers in the WWW

and give you the result.

I also propose a file database in root zone server where toplevel domain names are stored accessstats or some name.

If i access walkonyourtoes.com then access stats would have

walkonyourtoes.com 1, if another browser accesses walkonyourtoes.com accessstats would have walkonyourtoes 2 so at the end of the day accessstats would have all urls accessed during the day and the count and a topurls.com website can show the top accessed urls and also some display can be used to show birds eye view of http traffic of the day

There has to be another database accesspaths which shows the clientIP and accessed URL.. using which a birds eye view of the http accesses of the day can be seen on a display. It can be categorised all http accesses of pornography or related to pilates can be also seen.

The same computers that keep root zone database of TLDs should have some file that has all http url accesses in WWW and count.

If i access dhyanyoga.info/Californian.html the file or database would have an entry dhyanyoga.info/Californian.html 1  
if someone else accesses the count would increase
