A YANG Data Model for MPLS Base and Static LSPs
[draft-saad-mpls-static-yang-02](#)

Abstract

This document contains a specification of two YANG modules, the MPLS base, and Static LSP YANG modules. The MPLS base YANG module serves as a base framework for configuring and managing an MPLS switching subsystem. The MPLS Static LSP module augments the MPLS base YANG module with specific data to configure and manage MPLS Static LSP(s). It is expected that other MPLS YANG modules for MPLS technology YANG modules (e.g. MPLS LDP or MPLS RSVP-TE) will also augment the MPLS YANG base model.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on September 22, 2016.

[1. Introduction](#)

AAA

[1.1. Terminology](#)

In this document, the key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" are to be interpreted as described in [BCP 14](#), [RFC 2119](#) [[RFC2119](#)].

The following terms are defined in [[RFC6020](#)]:

Saad, et al.

Expires September 22, 2016

[Page 2]

- o augment,
- o configuration data,
- o data model,
- o data node,
- o feature,
- o mandatory node,
- o module,
- o schema tree,
- o state data,
- o RPC operation.

[2. Introduction](#)

A core routing data model is defined in [[I-D.ietf-netmod-routing-cfg](#)], and it proposes a basis for the development of data models for routing protocols. The MPLS base model augments this model with additional data specific to MPLS switching. The interface data model is defined in [[RFC7223](#)] and is used for referencing interface from the MPLS base model.

This document contains a specification of the following YANG modules:

- o Module "ietf-mpls" provides base components of the MPLS data model.
- o Module "ietf-mpls-static" that augments "ietf-mpls" with additional data specific to configuration and management of Static LSPs.

Note, it is expected that other MPLS YANG models to augment the "ietf-mpls" base model to define specific data to other MPLS technologies (e.g. MPLS LDP or MPLS RSVP-TE).

[2.1. Overview](#)

The MPLS base YANG module augments the "routing/routing-instance/routing- protocols/routing-protocol" path for the "rw" branch, and augments path "routing-state/routing-instance/routing- protocols/routing-protocol" for the "ro" branch of the ietf-routing module.

The approach described in [[I-D.openconfig-netmod-opstate](#)] is adopted to represent data pertaining to configuration intended, applied state and derived state data elements. Each container in the model holds a "config" and "state" sub-container. The "config" sub-container is used to represent the intended configurable parameters, and the state sub-container is used to represent both the applied configurable parameters and any derived state, such as counters or statistical information.

[2.1.1. MPLS Base Tree Diagram](#)

The MPLS base tree diagram is shown in Figure 1.

```
module: ietf-mpls
augment /rt:routing:
  +-rw mpls
    +-rw interface* [name]
      +-rw name      if:interface-ref
      +-rw config
        | +-rw enabled?  boolean
        +-ro state
          +-ro enabled?  boolean
augment /rt:routing-state:
  +-ro mpls
```

Figure 1: MPLS Base tree diagram

[2.1.2. MPLS Static LSP Tree Diagram](#)

The MPLS Static LSP tree diagram is shown in Figure 2.

```
module: ietf-mpls
augment /rt:routing:
  +-rw mpls
    +-rw interface* [name]
      | +-rw name      if:interface-ref
      | +-rw config
      |   | +-rw enabled?  boolean

Figure 4: MPLS Static LSP YANG module

3. IANA Considerations

This document registers the following URIs in the IETF XML registry [[RFC3688](#)]. Following the format in [[RFC3688](#)], the following registration is requested to be made.

URI: urn:ietf:params:xml:ns.yang:ietf-mpls XML: N/A, the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns.yang:ietf-mpls-static XML: N/A, the requested URI is an XML namespace.

This document registers a YANG module in the YANG Module Names registry [[RFC6020](#)].

name: ietf-mpls namespace: urn:ietf:params:xml:ns.yang:ietf-mpls
prefix: ietf-mpls reference: [RFC3031](#)

name: ietf-mpls-static namespace: urn:ietf:params:xml:ns.yang:ietf-mpls-static prefix: ietf-mpls-static reference: [RFC3031](#)

4. Security Considerations

The YANG module defined in this memo is designed to be accessed via the NETCONF protocol [[RFC6241](#)]. The lowest NETCONF layer is the secure transport layer and the mandatory-to-implement secure transport is SSH [[RFC6242](#)]. The NETCONF access control model [[RFC6536](#)] provides means to restrict access for particular NETCONF users to a pre-configured subset of all available NETCONF protocol operations and content.

There are a number of data nodes defined in the YANG module which are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., <edit-config>) to these data nodes without proper protection can have a negative effect on network operations.
