

**Feed Seek for the Atom Publishing Protocol
draft-sayre-atompub-protocol-seek-00.txt**

Status of this Memo

By submitting this Internet-Draft, each author represents that any applicable patent or other IPR claims of which he or she is aware have been or will be disclosed, and any of which he or she becomes aware will be disclosed, in accordance with [Section 6 of BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/1id-abstracts.txt>.

The list of Internet-Draft Shadow Directories can be accessed at <http://www.ietf.org/shadow.html>.

This Internet-Draft will expire on April 25, 2006.

Abstract

This memo presents a set of URI parameters used identify segments of an Atom Publishing Protocol feed. It also presents a syntax for declaring the placement of those parameters in a URI.

1. Introduction

When Atom Publishing Protocol [[APP-Basic](#)] clients encounter an APP collection, they may require smaller or larger frames of entries than the server provides by default. Most servers provide between 5 and 25 entries per Atom Feed Document [[AtomFormat](#)]. This frame can be far too large for a bandwidth and resource-constrained device, which might only have room to display two or three titles at a time. This frame can be far too small for a client attempting to sync up with a collection that contains many thousands of members.

2. Parameters

HTTP URIs [[RFC3986](#)] provide a useful mechanism for composing parameterized requests--the query string [[RFC2616](#)]. This document outlines four parameters that are generally useful to APP clients, but may not be useful for every APP collection.

count: The maximum number of Atom Entries to be included in the response. The field is an integer.

offset: The offset at which to begin the sequence of entries that match a given request. The field is an integer.

begin: Atom entries in the returned feed have an atom:updated date later in time than the 'begin' date. The field matches the syntax of an Atom Date Construct [[AtomFormat](#)].

end: Atom entries in the returned feed have an atom:updated date equal or earlier in time than the 'end' date. The field matches the syntax of an Atom Date Construct [[AtomFormat](#)].

None of the parameters are required, and servers could add additional parameters.

Example Selection URI (disregard line break)

```
http://example.com/foo?begin=2003-12-13T18:30:02Z\  
&end=2003-12-25T18:30:02Z&offset=2&count=4
```

Seek URIs are templated by surrounding the field names in brackets. For example, the 'count' field would appear as '{count}' in a template.

An example seek template:

```
http://example.com/app?b={begin}&e={end}&i={offset}&c={count}
```

All parameters are optional, so servers interpret requests with missing parameters using the list below:

If no 'end' field is present: The 'end' date is considered to be the updated date of the collection's most recently updated member resource.

If no 'begin' field is present: The 'begin' date is considered to be the update date of the collection's least recently updated member resource.

If no 'offset' field is present: The 'offset' integer is considered to be 0.

If no 'count' field is present: The 'count' integer is determined by the server.

3. The 'app:seek' Attribute

The "app:seek" attribute can be added to an anchor element contained in a server's XOXO Service Outline [[XOXO](#)]. When present, this namespace-qualified attribute provides a template for the parameterized GET requests described by this document. After substitution of the appropriate parameters, the resulting URI reference is interpreted relative to the in-scope base URI. The APP namespace is "http://purl.org/atom/app#". This document refers to it by using the prefix "app", but that prefix is arbitrary.

An example Service Outline with an app:seek attribute:

```
<ul class="xoxo" xmlns:app="http://purl.org/atom/app#">
  <li>
    <a href="/entries"
      app:select="/entries?b={begin}&e={end}&i={offset}&c={count}"
      rel="entry" type="application/atom+xml">Main Blog</a>
    <ul>
      <li><a href="/app/collection.py?id=2&type=media"
        rel="media" type="application/atom+xml">Photos</a>
      </li>
      <li><a href="/app/collection.py?id=14"
        rel="entry" type="application/atom+xml">Drafts</a>
      </li>
    </ul>
  </li>
  <li>
    <a href="/app.py?id=3&type=entries"
      app:select="/app.py?id=3&b={begin}&e={end}&i={offset}&c={count}"
      rel="entry" type="application/atom+xml">Side Bar Blog</a>
    <ul>
      <li><a href="/app/collection.py?id=4&type=media"
        rel="media" type="application/atom+xml">Stuff</a>
      </li>
    </ul>
  </li>
</ul>
```

4. Security Considerations

Malicious or buggy clients could mount a Denial-of-Service attack by sending large date ranges or integers as parameter values.

5. IANA Considerations

None
