

**Internet Media Type message/sipfrag
draft-sparks-sip-mimetypes-03**

Status of this Memo

This document is an Internet-Draft and is in full conformance with all provisions of [Section 10 of RFC2026](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/lid-abstracts.txt>.

The list of Internet-Draft Shadow Directories can be accessed at <http://www.ietf.org/shadow.html>.

This Internet-Draft will expire on October 25, 2002.

Abstract

This document registers the message/sipfrag MIME media type. This type is similar to message/sip, but allows fragments of well formed SIP messages to be used for the same tunnelling purposes as message/sip. In addition to end-to-end security uses, message/sipfrag is used with the REFER method to tunnel information about the status of a referenced request.

1. message/sipfrag

This document registers the message/sipfrag MIME media type. This type is similar to message/sip as defined in [1], but allows fragments of well formed SIP messages to be used for the same tunnelling purposes as message/sip. In addition to the end-to-end security uses discussed in [1], message/sipfrag is used in the REFER [2] to tunnel information about the status of a referenced request.

The motivation and examples of usage of message/sip as a security mechanism in concert with S/MIME are given in section 23.4 of [1]. These apply equally to message/sipfrag, with the additional benefit of being able to choose which portions of the message to protect.

Motivation and examples of usage of message/sipfrag to carry the status of referenced requests is provided in [2]. In particular, allowing only a portion of a SIP message to be carried allows information that could compromise privacy and confidentiality to be protected by removal.

Where a message/sip mime-part must be a complete well formed SIP message, a mime-part of type message/sipfrag can contain a subset of a SIP message. A valid message/sipfrag part is one that could be obtained by starting with some valid SIP message and deleting any of the following

- o the entire start line
- o one or more entire headers
- o the body

If the message/sipfrag part contains a body, it must also contain a Content-Length header and the null-line separating headers from the body.

2. IANA Considerations

The message/sipfrag media type is defined by the following information:

Media type name: message
Media subtype name: sipfrag
Required parameters: none
Optional parameters: version
 version: The SIP-Version number of the enclosed message
 (e.g., "2.0"). If not present, the version defaults to "2.0".
Encoding scheme: SIP messages consist of an 8-bit header optionally
 followed by a binary MIME data object. As such, SIP messages
 must be treated as binary. Under normal circumstances SIP
 messages are transported over binary-capable transports, no
 special encodings are needed.
Security considerations: see below

3. Security Considerations

A message/sip mime-part may contain sensitive information or information used to affect processing decisions at the receiver. When exposing that information or modifying it during transport would do harm its level of protection can be improved using the S/MIME mechanisms described in [section 23](#) of , with the limitations described in [section 26](#) of that document.
