Telemetry Data Export capability
draft-tao-netconf-data-export-capabilities-00

Abstract

This document proposes a YANG module for telemetry data export capability which augments system Capabilities model and provide additional telemetry data export attributes associated with system capability for transport dependent capability negotiation.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on September 4, 2020.

[1. Introduction](#)

Notification capability model defined in [[I-D.netconf-notification-capabilities](#)] allows a client to discover a set of capabilities supported by the server (e.g., basic system capability and YANG-Push related capabilities) both at implementation-time and run-time. These "capabilities" permit the client to adjust its behavior to take advantage of the features exposed by the device.

However pre-configuration for some transport specific parameters (e.g., transport protocol, encoding format, encryption by the client is still inevitable, which may cause unexpected failure and additional message exchange between client and server.

This document proposes a YANG module for telemetry data export capability which augments System Capabilities model and provide additional data export attributes for transport dependent capability negotiation.

[1.1. Terminology](#)

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [BCP 14](#) [[RFC2119](#)] [[RFC8174](#)] when, and only when, they appear in all capitals, as shown here.

[Page 2]

2. Data Export capability

The YANG module `ietf-notification-capabilities` defined in [I-D.netconf-notification-capabilities] specify the following server capabilities related to YANG Push:

- o A set of capabilities related to the amount of notifications the server can send out
- o Specification of which data nodes support on-change notifications.
- o Capability values can be specified on server level, datastore level or on specific data nodes (and their contained sub-tree) of a specific datastore. Capability values on a smaller, more specific part of the server's data always override more generic values.
- o On-change capability is not specified on a server level as different datastores usually have different on-change capabilities. On a datastore level on-change capability for configuration and state data can be specified separately.

These server capabilities are transport independent and session level capabilities and can be provided either at implementation time or reported at run time.

This document augments system Capabilities model and provides additional data export attributes associated with system capabilities:

- o Specification of transport protocol the client can use to establish transport connection;
- o Specification of encoding selection(e.g., XML or JSON, to binary) of Data Modeled with YANG;
- o Specification of secure transport mechanisms that are needed by the client to communicate with the server;
- o Specification of the type of data compression algorithm (e.g., lossless data compression) the client can use for file compression and decompression
- o Specification of Maximum number of data nodes that can be sent in a group of data node with the same characteristics;

Tao, et al.

Expires September 4, 2020

[Page 3]

- o Specification of the number of sensors group. A sensor group represents a reusable grouping of multiple paths and exclude filters.
- o Specification of the notification message encapsulation type, either one notification per message or multiple notifications per message.
- o Specification of the type of subscription, e.g., periodic subscription, on-change subscription, bulk subscription, adaptive subscription.
- o Specification of the time length of sampling interval.

[2.1. Tree Diagram](#)

The following tree diagram [[RFC8340](#)] provides an overview of the data model.

```

module: ietf-data-export-capabilities
augment /sysc:system-capabilities:
  +-ro data-export-capabilities
    +-ro transport-protocol          transport-protocol
    +-ro encoding-format            encoding-format
    +-ro secure-transport           secure-transport
    +-ro compression-mode          compression-mode
    +-ro max-nodes-per-sensor-group  uint32
    +-ro max-sensor-group-per-update  uint32
  augment /sysc:system-capabilities/inc:subscription-capabilities:
    +-ro message-bundling-support      boolean
    +-ro subscription-mode            subscription-mode
  augment /sysc:system-capabilities/sysc: datastore-capabilities/ +
    sysc:per-node-capabilities:
      +-ro sampling-interval*        centiseconds
      +-ro threshold-support         boolean

```

4. IANA Considerations

4.1. Updates to the IETF XML Registry

This document registers a URI in the "IETF XML Registry" [[RFC3688](#)]. Following the format in [[RFC3688](#)], the following registration has been made:

URI:

urn:ietf:params:xml:ns:yang:ietf-data-export-capabilities

Registrant Contact:

The IESG.

XML:

N/A; the requested URI is an XML namespace.

Tao, et al.

Expires September 4, 2020

[Page 9]

4.2. Updates to the YANG Module Names Registry

This document registers one YANG module in the "YANG Module Names" registry [[RFC6020](#)]. Following the format in [[RFC6020](#)], the following registration has been made:

```
name:  
  ietf-data-export-capabilities  
namespace:  
  urn:ietf:params:xml:ns:yang:ietf-data-export-capabilities  
prefix:  
  dec  
reference:  
  RFC XXXX (RFC Ed.: replace XXX with actual RFC number and remove  
this note.)
```

5. Security Considerations

The YANG module specified in this document defines a schema for data that is designed to be accessed via network management protocols such as NETCONF [[RFC6241](#)] or RESTCONF [[RFC8040](#)]. The lowest NETCONF layer is the secure transport layer, and the mandatory-to-implement secure transport is Secure Shell (SSH) [[RFC6242](#)]. The lowest RESTCONF layer is HTTPS, and the mandatory-to-implement secure transport is TLS [[RFC8446](#)].

The NETCONF Configuration Access Control Model (NACM) [[RFC8341](#)] provides the means to restrict access for particular NETCONF or RESTCONF users to a preconfigured subset of all available NETCONF or RESTCONF protocol operations and content.

There are a number of data nodes defined in this YANG module that are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive in some network environments. Write operations (e.g., edit-config) to these data nodes without proper protection can have a negative effect on network operations. These are the subtrees and data nodes and their sensitivity/vulnerability:

- o /sysc:system-capabilities/dec:transport-protocol
- o /sysc:system-capabilities/dec:encoding-format
- o /sysc:system-capabilities/dec:secure-transport
- o /sysc:system-capabilities/dec:compression-mode
- o /sysc:system-capabilities/dec:max-nodes-per-sensor-group

- o /sysc:system-capabilities/dec:sensor-group-count
- o /sysc:system-capabilities/inc:subscription-capabilities/dec:message-bundling-support
- o /sysc:system-capabilities/inc:subscription-capabilities/dec:subscription-mode
- o /sysc:system-capabilities/sysc: datastore-capabilities/sysc:per-node-capabilities/dec:sampling-interval
