**Telemetry Data Export capability**  
**draft-~~tao-netconf-data-export-capabilities-03~~**

Abstract

This document proposes a YANG module for telemetry data export capabilities which augments system Capabilities model and provides additional telemetry data export attributes associated with system capabilities for transport dependent capability advertisement.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on July 24, 2021.

## **1. Introduction**

Notification capabilities model defined in [I-D.netconf-notification-capabilities] allows a client to discover a set of capabilities supported by the server (e.g., basic system capabilities and YANG-Push related capabilities) both at implementation-time and run-time. These capabilities permit the client to adjust its behavior to take advantage of the features exposed by the device.

However the client and the server may still support various different transport specific parameters (e.g., transport protocol, encoding format, encryption). As described in [section 3.1 of \[RFC8641\]](#), a simple negotiation (i.e., inserting hints into error responses to a failed RPC request) between subscribers and publishers for subscription parameters increases the likelihood of success for subsequent RPC requests, but not guaranteed, which may cause unexpected failure or additional message exchange between client and server.

This document defines a corresponding solution that is built on top of [I-D.netconf-notification-capabilities]. Supplementing that work are YANG data model augmentations for transport dependent capability advertisement.

## **1.1. Terminology**

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [BCP 14 \[RFC2119\]](#) [[RFC8174](#)] when, and only when, they appear in all capitals, as shown here.

## **2. Data Export capability**

The YANG module `ietf-notification-capabilities` defined in [I-D.netconf-notification-capabilities] specify the following server capabilities related to YANG Push:

- o A set of capabilities related to the amount of notifications the server can send out
- o Specification of which data nodes support on-change notifications.
- o Capability values can be specified on server level, datastore level or on specific data nodes (and their contained sub-tree) of a specific datastore. Capability values on a smaller, more specific part of the server's data always override more generic values.
- o On-change capability is not specified on a server level as different datastores usually have different on-change capabilities. On a datastore level on-change capability for configuration and state data can be specified separately.

These server capabilities are transport independent, session level capabilities. They can be provided either at the implementation time or reported at the run time.

This document augments system Capabilities model and provides additional data export attributes associated with system capabilities:

- o Specification of transport protocol the client can use to establish a transport connection;
- o Specification of the encoding selection used (e.g., XML or JSON, Binary) for Data Modeled with YANG;
- o Specification of secure transport mechanisms that are needed by the client to communicate with the server;

- o Specification of the type of data compression algorithm (e.g., lossless data compression) the client can use for file compression and decompression
- o Specification of the notification message encapsulation type, either one notification per message or multiple notifications per message.
- o Specification of the update trigger type such as adaptive interval trigger, timer event based trigger, count threshold trigger, redundant suppression.

### 2.1. Tree Diagram

The following tree diagram [[RFC8340](#)] provides an overview of the data model.

```

module: ietf-data-export-capabilities
  augment /sysc:system-capabilities:
    +--ro data-export-capabilities* []
      +-ro transport-protocol?      identityref
      +-ro encoding-format?         identityref
      +-ro security-protocol?       identityref
      +-ro compression-mode?        identityref
  augment /sysc:system-capabilities/inc:subscription-capabilities:
    +--ro data-export-capabilities
      +-ro message-bundling-support? boolean
  augment /sysc:system-capabilities/sysc:datastore-capabilities/sysc:per-node-
capabilities:
    +--ro data-export-capabilities
      +-ro adaptive-interval-support    boolean
      +-ro timer-event-support?         boolean
      +-ro counter-threshold-support?   boolean
      +-ro suppress-redundant?          boolean

```

### 3. YANG Module

```

<CODE BEGINS> file "ietf-data-export-capabilities.yang"
module ietf-data-export-capabilities {
  yang-version 1.1;
  namespace "urn:ietf:params:xml:ns:yang:ietf-data-export-capabilities";
  prefix dec;

  import ietf-system-capabilities {
    prefix sysc;
  }
  import ietf-notification-capabilities {
    prefix inc;
  }
}

```

## **4. IANA Considerations**

### **4.1. Updates to the IETF XML Registry**

This document registers a URI in the "IETF XML Registry" [[RFC3688](#)]. Following the format in [[RFC3688](#)], the following registration has been made:

```
URI:
  urn:ietf:params:xml:ns:yang:ietf-data-export-capabilities
Registrant Contact:
  The IESG.
XML:
  N/A; the requested URI is an XML namespace.
```

### **4.2. Updates to the YANG Module Names Registry**

This document registers one YANG module in the "YANG Module Names" registry [[RFC6020](#)]. Following the format in [[RFC6020](#)], the following registration has been made:

```
name:
  ietf-data-export-capabilities
namespace:
  urn:ietf:params:xml:ns:yang:ietf-data-export-capabilities
prefix:
  dec
reference:
  RFC XXXX (RFC Ed.: replace XXX with actual RFC number and remove
```

this note.)

Wu, et al.

Expires July 24, 2021

[Page 10]

## 5. Security Considerations

The YANG module specified in this document defines a schema for data that is designed to be accessed via network management protocols such as NETCONF [[RFC6241](#)] or RESTCONF [[RFC8040](#)]. The lowest NETCONF layer is the secure transport layer, and the mandatory-to-implement secure transport is Secure Shell (SSH) [[RFC6242](#)]. The lowest RESTCONF layer is HTTPS, and the mandatory-to-implement secure transport is TLS [[RFC8446](#)].

The NETCONF Configuration Access Control Model (NACM) [[RFC8341](#)] provides the means to restrict access for particular NETCONF or RESTCONF users to a preconfigured subset of all available NETCONF or RESTCONF protocol operations and content.

There are a number of data nodes defined in this YANG module that are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive in some network environments. Write operations (e.g., edit-config) to these data nodes without proper protection can have a negative effect on network operations. These are the subtrees and data nodes and their sensitivity/vulnerability:

- o /sysc:system-capabilities/dec:transport-protocol
- o /sysc:system-capabilities/dec:encoding-format
- o /sysc:system-capabilities/dec:security-protocol
- o /sysc:system-capabilities/dec:compression-mode
- o /sysc:system-capabilities/inc:subscription-capabilities/  
dec:message-bundling-support

## **Appendix A. Usage Example of interaction with Adaptive Subscription**

The following instance-data example describes the notification capabilities of a hypothetical "acme-router". The router implements the running, and operational datastores. Every change can be reported on-change from running, but only config=true nodes and some config=false data from operational. Interface statistics are reported only when both adaptive-interval-support and count-threshold-support are set to true.

```
<?xml version="1.0" encoding="UTF-8"?>
<instance-data-set xmlns=
  "urn:ietf:params:xml:ns:yang:ietf-yang-instance-data">
  <name>acme-router-notification-capabilities</name>
  <content-schema>

  </content-schema>
  <!-- revision date, contact, etc. -->
  <description>Defines the notification capabilities of an acme-router.
    The router only has running, and operational datastores.
    Every change can be reported on-change from running, but
    only config=true nodes and some config=false data from operational.
    Statistics are not reported based on timer based trigger and counter
    threshold based trigger.
  </description>

</instance-data-set>
```

## [Appendix C](#). Changes between Revisions

v02 - v03

- o Change 'data-export-capabilities' into list type to support multiple transport protocol, encoding on the server.
- o Add Usage Example of interaction with UDP based Transport for Configured Subscription.
- o Add Thomas Graf as a contributor;
- o Update motivation in the introduction to clarify why this work is needed.
- o Support udp notif and http notif as two optional transport in the YANG data model.
