WebSocket Per-frame DEFLATE Extension
draft-tyoshino-hybi-websocket-perframe-deflate-05

Abstract

This specification defines a per-frame DEFLATE compression extension for the WebSocket Protocol. This extension compresses the "Application data" part of WebSocket data frames using DEFLATE.

Please send feedback to the hybi@ietf.org mailing list.

Status of this Memo

This Internet-Draft is submitted to IETF in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on August 5, 2012.

1. Introduction

This section is non-normative.

As well as other protocols, octets exchanged over the WebSocket Protocol [[RFC6455](#)] can benefit from compression. This specification adds DEFLATE [[RFC1951](#)] based compression functionality to the WebSocket Protocol using its extension framework.

Per-frame DEFLATE extension applies DEFLATE to the octets in the "Application data" part of data frames. To align the end of compressed data to octet boundary, this extension uses the algorithm described in the [Section 2.1](#) of the PPP Deflate Protocol [[RFC1979](#)]. Endpoints can take over the LZ77 sliding window [[LZ77](#)] used to build previous frames to get better compression ratio.

The simplest "Sec-WebSocket-Extensions" header in the client's opening handshake to request per-frame DEFLATE extension is the following:

```
Sec-WebSocket-Extensions: deflate-frame
```

The simplest header from the server to accept this extension is the same.

2. Conformance Requirements

Everything in this specification except for sections explicitly marked non-normative is normative.

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [[RFC2119](#)].

3. Extension Negotiation

The registered extension token for this extension is "deflate-frame".

To request use of per-frame DEFLATE extension, a client MUST include the "deflate-frame" extension token in the "Sec-WebSocket-Extensions" header in its opening handshake.

To accept use of per-frame DEFLATE extension requested by the client, a server MUST include the "deflate-frame" extension token in the "Sec-WebSocket-Extensions" header in its opening handshake.

An endpoint MAY attach one or more extension parameters as defined below to the extension token.

Maximum LZ77 sliding window size

An endpoint MAY attach "max_window_bits" extension parameter to limit the LZ77 sliding window size that the other peer uses to build frames. This parameter MUST have an integer value in the range between 8 to 15 indicating the base-2 logarithm of the LZ77 sliding window size. An endpoint that received this parameter MUST NOT use LZ77 sliding window size greater than this value to build frames.

Disallow compression context takeover

An endpoint MAY attach "no_context_takeover" extension parameter to disallow the other peer to take over the LZ77 sliding window used to build previous frames. This parameter has no value. An endpoint that received this parameter MUST use an empty LZ77 sliding window to build every frame.

A server MUST ignore any unknown extension parameter attached to "deflate-frame" extension token in the client's opening handshake.

A client MUST `_Fail the WebSocket Connection_` if any unknown extension parameter is attached to "deflate-frame" extension token in the server's opening handshake.

Once per-frame DEFLATE extension is accepted, both endpoints MUST use the algorithm described in [Section 4](#) to exchange frames.

4. Application Data Transformation

This extension uses one reserved bit to indicate whether DEFLATE is applied to the frame or not. We call this "COMP" bit.

This extension operates only on data frames, and only on the "Application data" therein (it does not affect the "Extension data" portion of the "Payload data").

4.1. Sending

To send a frame with DEFLATE applied, an endpoint MUST use the following algorithm.

1. Apply DEFLATE [[RFC1951](#)] to all the octets in the "Application data" part of the frame. Multiple blocks MAY be used. Any type of block MAY be used. Both block with "BFINAL" set to 0 and 1 MAY be used.
2. If the resulting data does not end with an empty block with no compression ("BTYPE" set to 0), append an empty block with no compression to the tail.
3. Remove 4 octets (that are 0x00 0x00 0xff 0xff) from the tail.
4. Build a frame by putting the resulting octets in the "Application data" part instead of the original octets. The payload length field of the frame MUST be the sum of the size of the "Extension data" part and these resulting octets. "COMP" bit MUST be set to 1.

An endpoint MUST NOT use LZ77 sliding window size greater than 32,768 to build frames.

If an endpoint received the "max_window_bits" extension parameter on opening handshake, it MUST NOT use LZ77 sliding window size greater than the "max_window_bits"-th power of 2 to build frames.

Unless it's prohibited by the other peer by the "no_context_takeover" extension parameter on opening handshake, an endpoint MAY take over the LZ77 sliding window used to build the last frame with DEFLATE applied.

To send a frame with DEFLATE not applied, an endpoint MUST set "COMP" bit of the frame to 0.

[Page

4.2. Receiving

To receive a frame with "COMP" bit set to 1, an endpoint MUST use the following algorithm.

1. Append 4 octets of 0x00 0x00 0xff 0xff to the tail of the "Application data" part.
2. Decode the resulting octets using DEFLATE.

Unless an endpoint sent the "max_window_bits" extension parameter on opening handshake, the endpoint MUST use 32,768 byte LZ77 sliding window to decode frames.

If an endpoint sent the "max_window_bits" extension parameter on opening handshake, it MAY reduce LZ77 sliding window size down to the "max_window_bits"-th power of 2 to decode frames.

Unless the endpoint sent the "no_context_takeover" extension parameter on opening handshake, an endpoint MUST take over the LZ77 sliding window used to decode the last frame with DEFLATE applied.

To receive a frame with "COMP" bit set to 0, an endpoint MUST receive it without any DEFLATE processing.

4.3. Examples

`_This section is non-normative._`

These are examples of resulting data after applying the algorithm above.

- o "Hello" in one compressed block
 - * 0xf2 0x48 0xcd 0xc9 0xc9 0x07 0x00
- o "Hello" in one compressed block in the next frame
 - * 0xf2 0x00 0x11 0x00 0x00
- o "Hello" in one block with no compression
 - * 0x00 0x05 0x00 0xfa 0xff 0x48 0x65 0x6c 0x6c 0x6f 0x00
- o "Hello" in one block with "BFINAL" set to 1
 - * 0xf3 0x48 0xcd 0xc9 0xc9 0x07 0x00 0x00

Yoshino
7]

Expires August 5, 2012

[Page

- o "He" and "llo" in separate blocks

- * 0xf2 0x48 0x05 0x00 0x00 0x00 0xff 0xff 0xca 0xc9 0xc9 0x07
0x00

5. Implementation Note

`_This section is non-normative._`

On common software development platforms, the operation of aligning compressed data to octet boundary using an empty block with no compression is available as library. For example, Zlib [[Zlib](#)] does this when "Z_SYNC_FLUSH" is passed to deflate function.

To get sufficient compression ratio, LZ77 sliding window size of 1,024 or more is recommended.

6. Security Considerations

There's no security concern for now.

7. IANA Considerations

7.1. Registration of the "deflate-frame" WebSocket Extension Name

This section describes a WebSocket extension name registration in the WebSocket Extension Name Registry. [[RFC6455](#)].

Extension Identifier
deflate-frame

Extension Common Name
WebSocket Per-frame DEFLATE

Extension Definition
[Section 3](#) and [Section 4](#) of this document.

Known Incompatible Extensions
None

The "deflate-frame" token is used in the "Sec-WebSocket-Extensions" header in the WebSocket opening handshake to negotiate use of per-frame DEFLATE compression extension.

7.2. Registration of the "COMP" WebSocket Framing Header Bit

This section describes a WebSocket framing header bit registration in the WebSocket Framing Header Bits Registry. [[RFC6455](#)]

Header Bit
RSV1

Common Name
COMP

Meaning
DEFLATE is applied to the frame or not.

Reference
[Section 4](#) of this document.

The "COMP" framing header bit is used to indicate whether the "Application data" part of the frame contains octets generated using DEFLATE or not.
