The rsync URI Scheme
draft-weiler-rsync-uri-01

Status of this Memo

This Internet-Draft is submitted to IETF in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/lid-abstracts.txt>.

The list of Internet-Draft Shadow Directories can be accessed at <http://www.ietf.org/shadow.html>.

This Internet-Draft will expire on January 26, 2010.

This document is subject to [BCP 78](#) and the IETF Trust's Legal Provisions Relating to IETF Documents in effect on the date of publication of this document (<http://trustee.ietf.org/license-info>). Please review these documents carefully, as they describe your rights and restrictions with respect to this document.

Internet-Draft

rsync URI

July 2009

Abstract

This document specifies the rsync Uniform Resource Identifier (URI) scheme.

1. Introduction

URIs were previously defined in [RFC 2396](#), which was updated by [RFC 3986](#) [[RFC3986](#)]. The procedures for registering new URI schemes are defined in [RFC 4395](#) [[RFC4395](#)]. This document defines a URI scheme for rsync.

2. rsync URI registration

This section contains the registration template for the rsync URI scheme in accordance with [RFC 4395](#) [[RFC4395](#)].

URI scheme name: rsync

Status: provisional

URI scheme syntax: An rsync URI describes a source or destination for the rsync application including a hostname, path, and optional user and port. The generic form of the rsync URI is:

rsync://[user@]host[:PORT]/Source

The rsync URI follows the general syntax from [RFC 3986](#) and is defined by the following ABNF:

```
rsyncurl      = "rsync:" hier-part
               ; See RFC 3986 for the definition
               ; of hier-part
```

URI scheme semantics: An rsync URI may be used as either a source or destination for the rsync application. If the port is not specified, it defaults to 873.

Encoding considerations: since the rsync URI is defined using standard elements from [RFC 3986](#), no special encoding considerations are present.

Applications/protocols that use this URI scheme name: the only application that uses rsync URIs is rsync.

Interoperability considerations: since only one application is

expected to make use of rsync URIs, this URI scheme is expected to have few interoperability concerns.

Security considerations: [Section 7 of RFC 3986](#) describes general security considerations for URI schemes. The considerations about reliability and consistency, malicious construction, rare IP address formats, sensitive information, and semantic attacks all apply to rsync URIs. The considerations about transcoding do not apply. Given how rsync is regularly used, it is expected that most applications will not be bothered by data accessed via a given rsync URI changing over time.

References: see [Section 5](#).

[3](#). IANA Considerations

IANA has registered the rsync provisional URI scheme using the template in [Section 2](#).

[4](#). Security Considerations

Many security considerations for the usage of URIs are discussed in [Section 7 of \[RFC3986\]](#). The considerations about reliability and consistency, malicious construction, rare IP address formats, sensitive information, and semantic attacks all apply to rsync URIs. The considerations about transcoding do not apply. The rsync URI scheme has no particularly unique security considerations.
