Generic Naming Attributes for the Generic Security Services Application  
Programming Interface (GSS-API)  
[draft-williams-kitten-generic-naming-attributes-00](#)

Abstract

This document specifies several useful generic naming attributes for use with the Generic Security Services Application Programming Interface (GSS-API) Naming Extensions specified in [RFC6680](#).

These attributes allow applications to extract discrete components of a GSS-API "mechanism name" (MN) object: issuer (e.g., realm name, domain name, certification authority name), service and host names (for host-based service names), user names, and others.

Status of this Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on January 8, 2014.

## **1. Introduction**

In [RFC6680](#) [[RFC6680](#)] we introduced an interface by which to access "attributes" of names. This document specifies some such attributes.

### **1.1. Conventions used in this document**

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [[RFC2119](#)].

## **2. Generic Attributes**

We add a number of generic attributes. Some of these attributes can be used as prefixes of other attributes.

### **2.1. Concrete Attributes**

These attributes generally have a single value. Only one of these attributes can also be used a prefix: the issuer name attribute.

#### **2.1.1. Issuer Name**

We add an attribute by which to obtain a name of an issuer of a mechanism name (MN) or of an attribute of an MN. The API name for this attribute is `GSS_C_ATTR_GENERIC_ISSUENAME`, and it's actual attribute name is `"urn:ietf:id:ietf-kitten-name-attrs-00-issuename"`.

The display form of issuer names is mechanism-specific.

The [non-display] form of issuer names SHALL be the exported name token form of the issuer's name. Not all mechanisms will support issuer names as MNs, therefore implementations MAY output a null non-display value.

For example, for the Kerberos mechanism [[RFC4121](#)] an issuer name would generally (but not always!) be a Kerberos realm name, probably display as just the realm name. (But note that there is not yet a Kerberos realm name as MN specification.)

This attribute can be used as prefix of other attributes. When used as a prefix, this attribute indicates that the application wishes to know the name of the issuer of the prefixed attribute of the given MN.

#### **2.1.2. User Name**

We add an attribute by which to obtain the component of an MN naming a user. The API name for this attribute is `GSS_C_ATTR_GENERIC_USERNAME`, and it's actual attribute name is `"urn:ietf:id:ietf-kitten-name-attrs-00-username"`.

The display form of user names is mechanism-specific.

The non-display form of user names is mechanism-specific.

Expires January 8, 2014

[Page 4]

### **2.1.3. Service Name**

We add an attribute by which to obtain the component of an MN naming a service as part of a host- or domain-based service name. The API name for this attribute is `GSS_C_ATTR_GENERIC_SERVICENAME`, and its actual attribute name is `"urn:ietf:id:ietf-kitten-name-attrs-00-servicename"`.

The display and non-display forms of service names are the same: a character string corresponding to the service names used, for example, in calls to `GSS_Import_name()` with the `GSS_C_NT_HOSTBASED_SERVICE` name-type.

### **2.1.4. Host Name**

We add an attribute by which to obtain the component of an MN naming a host as part of a host- or domain-based service name. The API name for this attribute is `GSS_C_ATTR_GENERIC_HOSTNAME`, and its actual attribute name is `"urn:ietf:id:ietf-kitten-name-attrs-00-hostname"`.

The display form of a host name MAY be stylized and SHOULD use U-labels [[RFC5890](#)].

The non-display form of host names SHOULD be a character string as described in [[RFC1123](#)], and SHOULD use A-labels [[RFC5890](#)].

### **2.1.5. Domain Name**

We add an attribute by which to obtain the component of an MN naming a domain as part of a domain-based service name. The API name for this attribute is `GSS_C_ATTR_GENERIC_DOMAINNAME`, and its actual attribute name is `"urn:ietf:id:ietf-kitten-name-attrs-00-domainname"`.

The display form of a domain name MAY be stylized and SHOULD use U-labels [[RFC5890](#)].

The non-display form of domain names SHOULD be a character string as described in [[RFC1035](#)], and SHOULD use A-labels [[RFC5890](#)].

## **2.2. Prefix Attributes**

`GSS_Get_name_attribute()` using attributes described in the preceding section SHALL fail if there are any name constraints that can be applied to the issuers of those names and, in applying those constraints, it is discovered that the issuer was not permitted to issue credentials for the MN.

For example, a Kerberos realm named `"FOO.EXAMPLE"` might not be

Williams

Expires January 8, 2014

[Page 5]

expected to issue credentials (tickets, keys) to host-based service names for hosts not ending in ".foo.example" or which are not "foo.example".

Several generic attribute prefixes are described below for overriding this behavior.

#### **2.2.1. GSS\_C\_ATTR\_GENERIC\_UNCONSTRAINED**

This attribute prefix, named GSS\_C\_ATTR\_GENERIC\_UNCONSTRAINED in the API, and with an actual name of "urn:ietf:id:ietf-kitten-name-attrs-00-gen-unconstrained", indicates that the application wants the value of the prefixed attribute without any name constraint checking.

#### **2.2.2. GSS\_C\_ATTR\_GENERIC\_UNCONSTRAINED\_OK**

This attribute prefix, named GSS\_C\_ATTR\_GENERIC\_UNCONSTRAINED\_OK in the API, and with an actual name of "urn:ietf:id:ietf-kitten-name-attrs-00-gen-unconstrained-ok", indicates that the application wants the value of the prefixed attribute regardless of any applicable naming constraints, but to indicate the name constraint status via the 'authenticated' output parameter of the GSS\_Get\_name\_attribute() interface.

#### **2.2.3. GSS\_C\_ATTR\_GENERIC\_FAST**

This attribute prefix, named GSS\_C\_ATTR\_GENERIC\_FAST in the API, and with an actual name of "urn:ietf:id:ietf-kitten-name-attrs-00-gen-fast", indicates that the application requires that the mechanism not perform any slow operations (e.g., connecting to a directory for the purposes of name constraint validation) in obtaining the prefixed attribute of the given MN.

### **3. Local Name Attributes**

Normally an Internet specification would not be expected to specify any local name attributes of GSS names. However, there is one common and very useful local name attribute, which we specify below.

Implementations are free to use different names for this attribute or exclude it altogether -- it is a local name attribute, after all.

#### **3.1. GSS\_C\_ATTR\_LOCAL\_LOGIN\_USER**

This attribute, with suggested API name `GSS_C_ATTR_LOCAL_LOGIN_USER`, and suggested actual name "local-login-user", requests a local user name corresponding to the given MN, if any.

Obtaining the local user name corresponding to an MN may require complex name mapping or lookup operations that are completely implementation-defined.

#### **4. Suggested Mechanism-Specific Name Attributes (INFORMATIONAL)**

[[anchor1: This section should really be split out into separate Internet-Drafts. It is here only because the author lacks the time at the moment of writing to create such separate I-Ds.]]

##### **4.1. Suggested Kerberos-Specific Name Attributes**

- o realm (corresponding to issuer name)
- o component 0 (first component of a principal name)
- o component 1 (second component of a principal name)
- o ..
- o component 9 (10th component of a principal name)
- o components (ordered set of components of a principal name)
- o transit path (ordered set of realm and CA names)
- o specific authorization data elements
- o PKINIT client certificate
- o session key enctype
- o encypes involved in transit path (this would only be available to initiators)

##### **4.2. Suggested PKU2U-Specific Name Attributes**

[[anchor2: Add reference to PKU2U.]]

- o issuer CA name
- o trust path to a trust anchor
- o certificate
- o certificate subject public key
- o certificate subject name
- o certificate subject alternate names

- o specific certificate extensions
- o certificate algorithm names
- o session key enctype

## **5. Security Considerations**

[Add text regarding name constraint checking and explaining the default-to-safe design of the generic name attributes defined in [section 2](#).]

## **6. IANA Considerations**

[Add text regarding the registration and assignment of the name attributes described in the preceding sections. In particular we should want these attributes' names to not reflect an Internet-Draft name, but an RFC number.]

## **7. References**
