**Symmetric RTP and RTCP Considered Helpful
draft-wing-mmusic-symmetric-rtp-rtcp-01**

Status of this Memo

This document is an Internet-Draft and is subject to all provisions of [section 3 of RFC 3667](#). By submitting this Internet-Draft, each author represents that any applicable patent or other IPR claims of which he or she is aware have been or will be disclosed, and any of which he or she become aware will be disclosed, in accordance with [RFC 3668](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/1id-abstracts.txt>.

The list of Internet-Draft Shadow Directories can be accessed at <http://www.ietf.org/shadow.html>.

This Internet-Draft will expire on April 7, 2005.

Abstract

This document defines symmetric RTP and symmetric RTCP and recommends their use.

Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC 2119](#) [1].

1. Introduction

Because RTP and RTCP are not inherently a bi-directional protocols, the usefulness of symmetry has been generally ignored. Many firewalls, NATs [6], and RTP implementations expect "Symmetric RTP", and do not work in the presense of non-symmetric RTP. However, this term has never been defined. This document defines Symmetric RTP and Symmetric RTCP.

TCP [3], which is inherently bidirectional, uses symmetric ports. That is, when a TCP connection is established from host A and its source TCP port "a" to a remote host, the remote host sends packets back to host A's source TCP port "a".

UDP isn't inherently bidirectional and UDP itself doesn't require similar port symmetry. Rather, some UDP applications (DNS [11]) have symmetry, some UDP applications (TFTP [12]) don't have symmetry, and other UDP applications (RTP [5]) don't mention symmetry.

2. Definitions

2.1 Symmetric RTP

The UDP port number for RTP media stream is usually communicated using SDP [7]. The SDP is usually carried by a signaling protocol such as SIP [8], SAP [9], or MGCP [10].

A device supports Symmetric RTP if, when receiving a bi-directional RTP media stream on UDP port A and IP address "a", it also transmits RTP media for that stream from the same source UDP port A and IP address "a".

A device which doesn't support Symmetric RTP would transmit RTP from a different port, or from a different IP address, than the port and IP address used to receive RTP.

2.2 Symmetric RTCP

The advertisement of the UDP port number for RTCP is usually communicated using SDP, and the port number is either implicit (RTP port + 1, as described in RFC3550 [5] section 11) or explicit (as described in Alternative Network Address Types [4]). The SDP is usually carried by a signaling protocol such as SIP, SAP, or MGCP.

A device supports Symmetric RCTP if, when receiving RTCP for a media stream on port B and IP address "b", it also transmits its RTCP messages for that stream from the same source UDP port B and IP address "b".

[Page 3]

A device which doesn't support Symmetric RTCP would transmit RTCP from a different port, or from a different IP address, than the port and IP address used to receive RTCP.

3. Recommended Usage

There are two specific instances where symmetric RTP and symmetric RTCP are required.

The first instance is NATs that lack integrated Application Layer Gateway (ALG) functionality. Such NATs require the RTP endpoint use UDP port symmetry to establish bi-directional traffic. ALGs are defined in [section 4.4 of RFC3022](#) [6].

The second instance is Session Border Controllers (SBCs) and TURN [13] servers, which relay RTP media and RTCP packets. Media relays are useful in conjunction with symmetric NATs to allow bi-directional UDP traffic across such NATs. However, if the RTP endpoint does not do symmetric RTP and symmetric RTCP, the media relay is unable to perform its function if there is a symmetric NAT in the path. "Symmetric NAT" is defined in [section 5 of RFC3489](#) [2].

There are other instances where symmetric RTP and symmetric RTCP are helpful, but not required. For example, if a firewall can expect symmetric RTP and symmetric RTCP then the firewall's dynamic per-call port filter list can be more restrictive compared to non-symmetric RTP and non-symmetric RTCP.

4. Security Considerations

There is no additional security exposure if a host complies with this specification.

5. IANA Considerations

This document doesn't require any IANA registrations.
