**P-Charge-Info - A Private Header Field (P-Header) Extension to the
Session Initiation Protocol (SIP)
draft-york-p-charge-info-08**

Abstract

This text documents the current usage of P-Charge-Info, an existing private Session Initiation Protocol (SIP) header field (P-Header) used to convey billing information about the party to be charged. This P-Header is currently used in production by several equipment vendors and carriers and has been in usage since at least 2007. This document is submitted to request the registration of this header field with the Internet Assigned Numbers Authority (IANA).

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on January 1, 2019.

[1.](#) Overview

In certain network configurations, several network entities have found it useful to decouple the identity of the caller (what is normally thought of as "Caller ID") from the identity/number used for billing purposes. This document records the current usage of P-Charge-Info, a private SIP header field, to provide simple billing information and requests the registration of this header field with IANA as required by [Section 4 of \[RFC5727\]](#).

In a typical configuration, the identity of the caller, commonly referred to as "Caller ID" by end users, is derived from one of the following SIP header fields:

- o P-Asserted-Identity
- o From (in the absence of P-Asserted-Identity)

(NOTE: Some service providers have also used the Remote-Party-ID header field but this was never standardized and was replaced by P-Asserted-Identity in [\[RFC3325\]](#).)

This identity/number is typically presented to the receiving user agent (UA) where it is usually displayed for the end user. It is also typically used for billing purposes by the network entities involved in carrying the session.

However, in some network configurations the "Caller ID" presented to the receiving UA may be different from the number to be used for billing purposes.

In this case, there exists a need for a way to pass an additional billing identifier that can be used between network entities in order to correctly bill for services.

Several carriers, application providers, and equipment providers have been using the P-Charge-Info header field since at least 2007 as a simple mechanism to exchange this billing identifier.

This document specifies the use of the P-Charge-Info header field in INVITE requests. The header field might be useful in other SIP messages, but such use is beyond the scope of this document.

2. Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [BCP 14](#) [\[RFC2119\]](#) [\[RFC8174\]](#) when, and only when, they appear in all capitals, as shown here.

The key words describe requirements needed to interoperate with existing usage.

3. Purpose of this Document

This document has been prepared to document the existing deployed usage of the P-Charge-Info header field and to comply with [Section 4 of \[RFC5727\]](#) to register this header field with IANA. It is noted that [RFC 5727](#) specifically deprecates new usage of "P-" header fields, but P-Charge-Info has been in deployment since prior to 2007 and pre-dates [RFC 5727](#). Given this, the authors request that P-Charge-Info be admitted as a "grandfathered case" per [Section 4 of RFC 5727](#).

4. Use Cases

The simplest use case for P-Charge-Info is an enterprise environment where each SIP endpoint has a direct number that is passed by the enterprise SIP proxy across to a SIP proxy at a SIP service provider who provides connectivity to the Public Switched Telephone Network (PSTN). Rather than cause the SIP service provider to have to track each individual direct number for billing purposes, the enterprise SIP proxy sends in the P-Charge-Info header field a single billing identifier that the SIP service provider uses for billing purposes.

As another example, a hosted telephony provider or hosted voice application provider may have a large SIP network with customers distributed over a very large geographic area using local market PSTN numbers but with only a very few actual PSTN interconnection points.

The customers may all have local phone numbers yet outgoing calls are actually routed across a SIP network and out specific PSTN gateways or across specific SIP connections to other SIP service providers. The hosted provider may want to pass a billing identifier to its SIP service providers either for the purpose of simplicity in billing or to obtain better rates from the SIP service providers.

5. The P-Charge-Info Header

5.1. Applicability Statement for the P-Charge-Info header field

The P-Charge-Info header field is applicable within a single private administrative domain or between different administrative domains where there is a trust relationship between the domains.

5.2. Usage of the P-Charge-Info header field

The P-Charge-Info header field is used to convey information about the identity of the party to be charged. The P-Charge-Info header field is typically inserted into a SIP request, usually an INVITE, by one of the following:

- o the SIP proxy on the originating network;
- o a PSTN gateway acting as a SIP UA; or
- o an application server generating billing information.

P-Charge-Info is to be used by the SIP entity that provides billing services for a session. This could be an entity generating billing records or an entity interacting with another entity generating billing records. Upon receipt of an INVITE request with the P-Charge-Info header field, such an entity MAY use the value present in P-Charge-Info as indicating the party responsible for the charges associated with the session. This decision, for example, could be based on local policy.

5.2.1. Procedures at the UA

The P-Charge-Info header field may be inserted by PSTN gateways or application servers acting as a SIP UA.

The P-Charge-Info header field is ignored by an end-user UA and should not normally be received by such a UA. It MUST NOT be sent to such a UA as this would provide information about party to be charged to the UA, which may cause security related issues, e.g. calling party information would be known by the UA for an otherwise anonymous call. A UA SHOULD ignore it if it receives this header. Similarly, an end-user UA originating a SIP message SHOULD NOT insert this header field.

A PSTN gateway or application server acting as a UA MAY use the content of the P-Charge-Info header field present in an INVITE request it received for billing related procedures, e.g. in a billing record or during interaction with another entity generating billing records, as the identity of the party to be charged for the session. A PSTN gateway or application server acting as a UA MAY use the content of the P-Charge-Info header field to populate information about the identity of the party to charge in another type of signaling, e.g. ISUP.

5.2.2. Procedures at the Proxy

A SIP proxy that supports this extension and receives a request, typically a SIP INVITE, MAY insert a P-Charge-Info header field. The contents of the inserted header field may be decided based on local policy or by querying an external entity to determine the identity of the party to be charged.

A proxy MAY use the content of the P-Charge-Info header field present in an INVITE request it received for billing related procedures, e.g. in a billing record or during interaction with another entity generating billing records.

A SIP proxy that does not support this extension will pass any received P-Charge-Info header field unmodified in compliance with [RFC 3261](#).

A proxy supporting this extension MUST remove the P-Charge-Info header field before sending a request to a UA that is not acting as a PSTN gateway or appropriate application server, if the role of the UA is known.

5.3. Example of Usage

The content of the P-Charge-Info header field is typically just a SIP/tel URI used as a billing indicator. An example could be as simple as one of:

P-Charge-Info: <sip:+14075550134@example.net;user=phone>

P-Charge-Info: <sip:+12345550167@example.com>

P-Charge-Info: <sips:1234@example.com>

P-Charge-Info: <tel:+14075551234>

Any other applicable SIP URI could be used.

6. Formal Syntax

This RFC contains the definition of one or more SIP header fields that allow choosing between addr-spec and name-addr when constructing header field values. [\[RFC8217\]](#) prohibits the use of addr-spec if its value would contain a comma, semicolon, or question mark.

The Private Header Field specified in this document is described in both prose and an augmented Backus-Naur Form (BNF) defined in [\[RFC5234\]](#). Further, several BNF definitions are inherited from SIP and are not repeated here. Implementors need to be familiar with the notation and contents of [\[RFC3261\]](#) and [\[RFC5234\]](#) to understand this document.

The syntax of the P-Charge-Info header field is described as follows:

```
P-Charge-Info = "P-Charge-Info" HCOLON (name-addr / addr-spec)
                ; name-addr and addr-spec are specified in RFC 3261
```

The SIP URI contained in the name-addr/addr-spec is the billing indicator that is passed between the parties.

7. IANA Considerations

This specification registers a new proprietary SIP header field according to the procedures defined in [[RFC5727](#)].

7.1. Header Field

The header field described in [Section 7](#) is registered in the "Header Fields" sub-registry of the "Session Initiation Protocol (SIP) Parameters" registry by adding a row with these values:

Header Field Name: P-Charge-Info

Compact Form: none

Reference: [TBD: This document]

8. Security Considerations

8.1. Trust Relationship

Given that the information contained in the P-Charge-Info header field will be used for billing purposes, the proxies and other SIP entities that share this information **MUST** have a trust relationship.

If an untrusted entity were inserted between the trusted entities, it could potentially interfere with the billing records for the call.

If the SIP connections are not made over a private network, a mechanism for securing the confidentiality and integrity of the SIP connection **MUST** be used to protect the information. One such mechanism could be TLS-encryption of the SIP signaling stream.

8.2. Untrusted Peers

8.2.1. Ingress from Untrusted Peers

If the P-Charge-Info header field was accepted by a SIP entity from an untrusted peer, there is the potential for fraud if the untrusted entity sent incorrect information, either inadvertently or maliciously.

Therefore a SIP entity **MUST** remove and ignore the P-Charge-Info header field when it is received from an untrusted entity.

8.2.2. Egress to Untrusted Peers

If the P-Charge-Info header field was sent by a SIP entity to an untrusted peer, there is the potential exposure of network information that is internal to a trust domain. For instance, the untrusted entity may learn the identities of public SIP proxies used within the trust domain which could then potentially be directly attacked.

If an implementation does not strip P-Charge-Info from the message where specified in this document, it introduces serious privacy risks. Examples include revealing third-party billing relationships that might be sensitive, as well as unmasking the identity of callers who wish to remain anonymous. Depending on circumstances, the latter case may result in unwanted harassment and even physical harm to the calling party.

Therefore a SIP entity **MUST** remove the P-Charge-Info header field when it is sent to an untrusted entity.

9. Acknowledgements

The authors thank the following people for their comments: Keith Drage, Miguel Garcia, Sumit Garg, John Haluska, Juha Heinanen, Christer Holmberg, Paul Kyzivat, Adam Roach, Jonathan Rosenberg, Henning Schulzrinne, Tom Taylor and Glen Wang.

[Appendix A](#). Alternatives

[A.1](#). P-Charging-Vector

P-Charging-Vector is defined in [Section 4.6 of \[RFC7315\]](#) and used by the 3GPP to carry information related to the charging of a session. There are, however, some differences in the semantics associated with P-Charging-Vector and P-Charge-Info. P-Charging-Vector is mainly used to carry information for correlation of multiple charging records generated for a single session. On the other hand, P-Charge-Info is used to convey information about the party to be billed for a call. Furthermore, P-Charging-Vector has a mandatory `icid-value` parameter that is a globally unique value to identify the session for which the charging information is generated. Such a globally-unique identifier is not necessary when carrying information about the user

to be billed when it is attached to the corresponding session-related signaling.

A.2. P-DCS-Billing-Info

P-DCS-Billing-Info is defined in [Section 7 of \[RFC5503\]](#) and used for passing billing information between trusted entities in the PacketCable Distributed Call Signaling Architecture. For many billing situations, particularly the very large-scale residential telephone networks for which this header field is designed, P-DCS-Billing-Info is an excellent solution. However, this ability to address a range of situations adds complexity. According to [RFC 5503](#), the following information is mandatory to include in each use of the P-DCS-Billing-Info header field:

- o Billing-Correlation-ID, a globally unique identifier
- o Financial-Entity-ID
- o RKS-Group-ID (record keeping server)

and may include a variety of additional parameters.

While this may work well in many billing scenarios, there are other billing scenarios that do not need this level of complexity. In those simpler scenarios all that is needed is simply a number to use for billing. P-Charge-Info provides this simple solution for simple billing scenarios.

Additionally, according to [Section 7.3 of RFC 5503](#), it is mandatory for a UA to create a Billing-Correlation-ID and insert this into the P-DCS-Billing-Info header field (along with the other required information) sent in the initial SIP INVITE. This again makes sense for the residential telephone service environment for which this header field is designed. In contrast, P-Charge-Info is designed to be used among proxies and not to be used at all by normal user agents. (P-Charge-Info may, though, be used by user agents associated with PSTN gateways.)

A.3. P-Asserted-Identity

Early reviewers of this document asked why the P-Asserted-Identity header field documented in [\[RFC3325\]](#) could not be used. As mentioned in the use case example above, P-Asserted-Identity is used to indicate the identity of the calling party. However, in this instance, the requirement is to provide an additional identity of the SIP-to-PSTN interconnect point.

It would be typical to find both P-Asserted-Identity and P-Charge-Info used in a SIP exchange. P-Asserted-Identity would be used to provide the caller identity which would be displayed to the end user as "Caller ID" while P-Charge-Info would provide the billing identifier used for the billing associated with the call.

Appendix B. Changes

NOTE TO RFC EDITOR - Please remove this "Changes" section prior to publication. Thank you.

Revision -08 incorporates significant feedback from Ben Campbell including:

- o Moving section on alternatives to an Appendix;
- o Clarifying some uses of normative language;
- o Moving RFCs 3261 and 8217 to Normative references; and
- o multiple small tweaks to the text.

Revision -07 incorporates significant feedback from Jean Mahoney including:

- o Updating references to obsolete RFCs;
- o Updating IANA considerations section;
- o Changing example phone numbers; and
- o multiple editorial and proofreading updates.

Revision -06 fixes one nit and updates the Requirements Language to comply with [BCP 14](#) / [RFC 8174](#).

Revision -05 fixed a few typos and had other editorial changes.

Revision -04 removes the PASSport and [RFC 8224](#)/8225 references (inserted in Revision -03), as it was decided to capture that usage in a separate draft.

Revision -03 incorporates feedback from the expert review by Adam Roach, including:

- o changing all references to "header" to be "header field";
- o the addition of references to RFCs 8224 and 8225 related to STIR;

- o a reference to [RFC 8217](#) in the formal syntax; and
- o multiple editorial and proofreading updates.

Revision -02 incorporates a range of feedback provided by Henning Schulzrinne.

Revision -01 is a refresh as -00 expired. The affiliation of Tolga Asveren was changed to Ribbon Communications.

Revision -00 strips out the NPI and NOA parameters to focus only on the usage in a pure SIP-to-SIP environment. Multiple editing changes were made for readability.

NAME CHANGE - The document is now "[draft-york-p-charge-info](#)" to reflect the fact that the publishing route for the draft is being determined.

Revision -06 updates the text for 2017 and changes Dan York's affiliation to "Individual".

Revision -05 is a refresh as -04 expired. Several small tweaks were also made to narrative text.

Revision -04 is purely a refresh as -03 expired.

Revision -03 is purely a refresh as -02 expired.

Revision -02 is purely a refresh as -01 expired. My hope is to move this document forward soon to put closure on it.

Revision -01 is purely a refresh as -00 expired. Only a few minor tweaks to this "Changes" section of the document.

Revision -00 is the initial release of "[draft-york-dispatch-p-charge-info](#)" and is identical to "[draft-york-sipping-p-charge-info-15](#)" except for changes to wording to reflect the change to the DISPATCH working group. The "organization" name for Dan York was also changed from blank to "DisTel Research" to remove the confusion that it looked like he was also employed by Sonus Networks.

NAME CHANGE - The document is now "[draft-york-dispatch-p-charge-info](#)" to reflect the fact that the SIPPING Working Group no longer exists.

Revision -15 simply fixes a wording error in the abstract in the previous revision. This will also be the last version of '[draft-york-sipping-p-charge-info](#)'. The next version will be '[draft-york-dispatch-p-charge-info](#)'.

Revision -14 incorporates the following changes:

- o Two examples were updated to include a "+1" at the beginning of the SIP URI.
- o An example was changed to use "example.net" to be compliant with [RFC 2606](#).
- o Dan York's organization was updated to "Individual" (from empty) to indicate that his involvement with this draft is purely as an individual with no connection to his employer.
- o The length of time the header has been used in the Introduction was changed to 7 years, to reflect the first usage around 2005.
- o A note was added to the abstract indicating that this is expected to be the last version using the name '[draft-york-sipping-p-charge-info](#)'.
- o Informative references were added to [RFC 3261](#) and [RFC 2234](#) to address missing references in the text.
- o Numerous other tweaks to the text for readability.

Revision -13 has no changes to content and was issued as -12 expired. Discussions are under way coming out of IETF 83 on a plan to move this draft forward. As the SIPPING working group no longer exists, the draft name needs to change and there are a couple of other required changes.

Revision -12 included the following modifications based on feedback from John Haluska and Glen Wang:

- o Modification of [Appendix B](#) to reflect ANSI T1.113 values.

Revision -11 represents a fairly significant revision responding to a solid review by Paul Kyzivat and providing additional explanation. A major shift was the move to using decimal values for the np-value parameter versus the text values of previous drafts. Changes include:

- o ABNF definition updated to indicate that np is now a number vs text.
- o The "np" and "na" acronyms were expanded and stated near the formal syntax definition.
- o New section created explicitly mentioning the optional parameters.

- o Example of optional parameters updated to have npf use a number vs text.
- o [Appendix B](#) added to give examples of NOA parameter.
- o Overview text updated to indicate that P-Charge-Info was been in use now for over 5 years (given that the draft has been in development for 3 years).
- o Several small fixes for readability.

Revision -10 included the following modifications:

- o Formal ABNF definition updated.
- o In formal syntax, semicolons added to npf-param and noa-param definitions.
- o npf-param changed to a 'gen-value' to use digits vs text. Values npf-param are shown in [Appendix A](#).
- o Corrected example to show proper use of parameters.
- o Updated references to [RFC 3427](#) and [RFC 3968](#) to reference [RFC 5727](#).

Revision -09 included the following modifications:

- o Re-submitted with only a date change. Discussions are ongoing to finalize this draft and submit it for expert review.

Revision -08 included the following modifications:

- o The ABNF for the "npf-value" was modified to conform to the sequence of possible values stated in ANSI T1.113.
- o An [Appendix A](#) was created listing the values from ANSI T1.113.

Revision -07 was updated to the "trust200902" IPR statement and added references to [RFC 3968](#). At this point all comments have been incorporated and publication will be requested.

Revision -06 had only a minor correction to the second usage example. The IPR statement was also updated to comply with [RFC 5378](#).

Revision -05 included the following modifications:

- o The usage of P-Charge-Info for carrying the ISUP Charge Number parameter was formally incorporated into the draft. Previous

revisions had mentioned it as a possible use case but had not really explicitly included it.

- o The examples/use cases section was expanded to include further examples of where P-Charge-Info may be used.
- o The original use case which discussed inter/intra-state billing practices was changed as the geographical references were clouding the more fundamental issue.
- o The "UNKNOWN" value was added to the ABNF for the "npi-value" parameter as that was identified as missing but required for ISUP interworking.
- o The optional "Nature of Address" parameter was added to support interworking with the ISUP Charge Number.

Revision -04 corrected a major error in the example where the parameter was placed inside the angle brackets. The P-DCS-Billing-Info header was also added as an alternative and a few minor edits were made.
