Multi-Subject JSON Web Token (JWT)
draft-yusef-oauth-nested-jwt-04

Abstract

This specification defines a mechanism for including multiple subjects in a JWT. A primary subject in an enclosing JWT with its own claims, and a related subject in a nested JWT with its own claims.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on September 11, 2021.

1. Introduction

JSON Web Token (JWT) [RFC7519] is a mechanism that is used to transfer claims between two parties across security domains. Nested JWT is a JWT in which the payload is another JWT. The current specification does not define a means by which the enclosing JWT could have its own Claims Set, only the enclosed JWT would have claims.

There are a number of use cases where there is a need to represent
This specification defines a mechanism for including multiple subjects in a JWT. A primary subject in an enclosing JWT with its

own claims, and a related subject in a nested JWT with its own claims.

1.1. Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT",
"SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this
document are to be interpreted as described in [RFC8174].

2. Use Cases

The following are few categories of use cases that might benefit from such a concept:

2.1. Primary Subject with Secondary Authority Subject

A primary subject with a related secondary subject that has authority over the primary subject, e.g. Child/Parent, Pet/Owner.

The secondary user (e.g., parent) logs in to an application (e.g., pharmacy application), gets redirected to the authorization server, authenticates, and asks for permission to access resources (e.g., medication) for the primary subject (e.g., child). The authorization server then issues a JWT with the primary subject in the enclosing JWT and the secondary subject in the nested JWT.

In this case, both JWTs are issued by the same issuer.

2.2. Multiple Primary Subjects

Two or more primary related subjects e.g. a married couple. The authorization server is setup to provide one of the subjects with permissions to access the other related subject resources.

One user (e.g., wife) logs in to a application (e.g., pharmacy application), gets redirected to the authorization server,
authenticates, and asks for permission to access resources (e.g., medication) for the other primary subject (e.g., husband). The authorization server then issues a JWT with the primary subject in the enclosing JWT and the other primary subject in the nested JWT.

In this case, both JWTs are issued by the same issuer.

2.3. Delegation of Authority

A primary subject delegates authority over a resource to a secondary subject who acts on behalf of the primary subject, as defined in [RFC8693].

2.4. Replaced Primary Subjects

A primary subject is replaced with a new primary subject, and the original primary subject included in the new issued JWT as a nested JWT.

2.4.1. STIR

[RFC8225] defines a PASSporT, which is a JWT, that is used to verify the identity of a caller in an incoming call.

The PASSporT Extension for Diverted Calls draft [STIR] uses a nested PASSporT to deliver the details of an incoming call that get redirected. An authentication service acting for a retargeting entity generates new PASSporT and embeds the original PASSporT inside the new one. When the new target receives the nested PASSporT it will be able to validate the enclosing PASSporT and use the details of the enclosed PASSporT to identify the original target.

In this case, the original JWT is issued by the calling service, and the new enclosing JWT is issued by the retargeting service.

2.4.2. Network Service Mesh (NSM)

Network Service Mesh [NSM] is a mechanism that maps the concept of a service mesh in Kubernetes to L2/L3 payloads.
NSM GRPS messages may pass through multiple intermediaries, each of which may transform the message. Each intermediary is expected to create its own JWT token, and include a claim that contains the JWT it received with the message it has transformed.

In this case, the original JWT is issued by the entity sending the initial message, and the new enclosing JWT is issued by the intermediate entity.

3. JWT Content

The payload of the enclosing JWT is a JSON object that contains the Claims Set of the primary subject, and one new claim that is used to hold the enclosed JWT and its relation to the primary subject.

This document defines a new claim, "rsub" (Related Subject) Claim, that is used to contain the enclosed JWT and its relation to the primary subject.

4. Example

```json
{
    "alg": "HS256",
    "typ": "JWT",
}

{
    "sub": "1234567890",
    "name": "John Doe",
    "iat": 1516239022,
    "rsub": {
        "jwt": "<jwt>"
    }
}
```
