A YANG Data Model for Layer 1 (ODU) Network Topology

[draft-zhang-ccamp-l1-topo-yang-03.txt](#)

Abstract

A transport network is a server-layer network designed to provide connectivity services for a client-layer network to carry the client traffic opaquely across the server-layer network resources. A transport network may be constructed from equipment utilizing any of a number of different transport technologies such as the evolving optical transport infrastructure (Synchronous Optical Networking (SONET) / Synchronous Digital Hierarchy (SDH) and Optical Transport Network (OTN)) or packet transport as epitomized by the MPLS Transport Profile (MPLS-TP).

This draft describes a YANG data model to manipulate the topologies of a layer 1 Optical Transport Network (OTN). It is independent of control plane protocols and captures topology related information pertaining to OTN and also enables manipulation (e.g., obtaining) of an OTN network.

Status of this Memo

This Internet-Draft is submitted to IETF in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at
<http://www.ietf.org/1id-abstracts.txt>.

The list of Internet-Draft Shadow Directories can be accessed at
<http://www.ietf.org/shadow.html>.

This Internet-Draft will expire on January 6th, 2017.

1. Introduction

A transport network is a server-layer network designed to provide connectivity services for a client-layer network to carry the client traffic opaquely across the server-layer network resources. A transport network may be constructed from equipment utilizing any of a number of different transport technologies such as the evolving optical transport infrastructure (Synchronous Optical Networking (SONET) / Synchronous Digital Hierarchy (SDH) and Optical Transport Network (OTN)) or packet transport as epitomized by the MPLS Transport Profile (MPLS-TP).

This document defines a data model of a layer one network topology, using YANG [[RFC6020](#)]. The model can be used by an application exposing to a management system. Moreover, it can also be used by an application in the following ways (but not limited to):

- o to obtain a whole view of the network topology information of its interest e.g., via a network element or maybe a controller or a network management system within the network ;
- o to receive notifications with regard to the information of the change of the network topology of its interest;
- o to enforce the establishment/update of a network topology with the characteristic specified in the data model, e.g., by a network controller or a client controller to manipulate the network provided by the provider for flexible control and management;

The YANG model defined in this draft is independent of control plane protocols and captures topology related information pertaining to an Optical Transport Networks (OTN)-electronic layer and also enables manipulation of an OTN network. Other network layers, such as fixed Dense Wavelength Switched Optical Network (WSON) and flexible optical networks (a.k.a., flexi-grid networks) are covered in [WSON-YANG] and [[Flexi-YANG](#)], respectively.

2. Conventions used in this document

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC-2119](#) [[RFC2119](#)].

3. Terminology and Notations

A simplified graphical representation of the data model is used in this document. The meaning of the symbols in the YANG data tree

presented later in this draft is defined in [[ietf-netmod-rfc6087bis](#)]. They are provided below for reference.

- o Brackets "[" and "]" enclose list keys.
- o Abbreviations before data node names: "rw" means configuration (read-write) and "ro" state data (read-only).
- o Symbols after data node names: "?" means an optional node, "!" means a presence container, and "*" denotes a list and leaf-list.
- o Parentheses enclose choice and case nodes, and case nodes are also marked with a colon ":").
- o Ellipsis ("...") stands for contents of subtrees that are not shown.

[4.1.1. Augmentation](#)

As can be seen, from the tree shown in [Section 4.1](#), the YANG module presented augments from a more generic Traffic Engineered (TE) network topology model, i.e., the `ietf-te-topology` YANG module as specified in [[draft-ietf-teas-yang-te-topo-04](#)].

Note the model in this draft uses the YANG model named `ietf-transport-types.yang` defined in [[draft-sharma-ccamp-otn-service-model-00](#)].

[4.1.2. The node and link list](#)

The module presented in this draft contains all the nodes and links information pertaining to a layer one network. As specified in the `ietf-network` YANG module, a node is identified by the `node-id`, which is unique within the network. Within the nodes, all the interfaces pertaining to this node and their potential capabilities/constraints SHOULD be present.

Similarly, a link is identified by the `link-id`, which is unique within a node. It includes the association with nodes as well as

interfaces. Moreover, it includes information that is of interest to the client, for purposes, such as path computation, monitoring etc.

Since for an optical transport network, its client interface attributes has technology-specific attributes that need to be captured to give the client all the necessary information for its use. For full control purpose, this attributes and information are also captured and listed in this YANG module.

<CODE ENDS>
```

5. Security Considerations

Since the data model defined in this draft is manipulated via, for example, the interface between an orchestrator and a transport network controller. The security concerns mentioned in [[draft-ietf-teas-yang-te-topo-04](#)] also applies to this draft.

The YANG module defined in this memo is designed to be accessed via the RESTCONF protocol defined in [[draft-ietf-netconf-restconf-13](#)] , or maybe via the NETCONF protocol [[RFC6241](#)].

There are a number of data nodes defined in the YANG module which are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., <POST>) to these data nodes without proper protection can have a negative effect on network operations.

[Editor's note: to List specific subtrees and data nodes and their sensitivity/vulnerability.]

6. Manageability Considerations

TBD.

7. IANA Considerations

TBD.

8. Acknowledgements

The initial YANG model specified in this draft is based on [draft-clemm-i2rs-yang-network-topo](#) but it is modified according to the features of the layer one networks.

We would like to thank the authors of the above mentioned draft for their helpful discussion during the creation of this draft.
