Route Target Constrain Extension
draft-zzhang-idr-bgp-rt-constrains-extension-00

Abstract

This document specifies the extensions to Route Target Constrain mechanism so that it works with various types of Route Targets of arbitrary lengths.

Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [BCP 14](#) [[RFC2119](#)] [[RFC8174](#)] when, and only when, they appear in all capitals, as shown here.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of [BCP 78](#) and [BCP 79](#).

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on January 13, 2021.

[1.](#) Introduction

The importation and propagation of BGP routes can be controlled using Route Targets [[RFC4364](#)] and Route Target Constrains [[RFC4684](#)].

A Route Target (RT) could be an 8-octet BGP Extended Community (EC) or a 20-octet IPv6 Address Sepcific EC, though the RT Constrain mechanism specified in [[RFC4684](#)] was designed for the 8-octet RTs only.

[I-D.ietf-idr-bgp-ipv6-rt-constrain] extends the mechanism to handle IPv6 Address Specific RTs by allowing the NLRI prefix to be of 0 to 24 octets (vs. 0 to 12 octets as in [[RFC4684](#)]):

```

+-----+
| origin as      (4 octets) |
+-----+
| route target  (8 or 20 octets)|
~
|
+-----+
```

There is a limitation with the approach in [I-D.ietf-idr-bgp-ipv6-rt-constrain] - when the prefix is not more than 12 octets, there is no way to determine if the route target part is a partial IPv6 Address Sepcific RT or a full/partial AS or IPv4 Address Specific RT.

Additional types of RTs of arbitrary lengths could also be defined, e.g. [I-D.zzhang-idr-bitmask-route-target]. To extend the RT Constrain mechanisms in a generic way so that any foreseeable types of RTs can be used, this document proposes the extensions specified in the following section.

While the extended mechanism specified in this document can be used for existing RTs including IPv6 Address Specific RTs, it is not the intention of this document to replace or obsolete the mechanism defined in [I-D.ietf-idr-bgp-ipv6-rt-constrain], given its current status and potential existing implementations and deployments. An operator may choose either way as long as there is no ambiguity.

2. Specification

To advertise Route Target Membership with various types of RTs, a new NLRI encoding with a new SAFI "Extended Route Target constrains" is used as following:

```

      0               1               2               3
      0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
|               Origin AS               |
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
| Path Attr Type |   Route Target   ~
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
~ Route Target (continued, variable length ) ~
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+

```

The one-octet "Path Attr Type" indicates the category of Route Target that follows it, using the type of BGP Path Attribute for the RT. For example, the "Path Attr Type" is 16 (Extended Community) for regular RTs, 25 (IPv6 Address Specific Extended Community) for IPv6 Address Specific RTs, or 34 (BGP Community Container Attribute) for any RT defined as a BGP Community Container (e.g. [I-D.zzhang-idr-bitmask-route-target]).

Similar to [RFC4684], except for the default route target, which is encoded as a zero-length prefix, the minimum prefix length is 40 bits - the Origin AS field and the Path Attr Type field cannot be interpreted as a prefix. Route targets MAY then be expressed as prefixes, where, for instance, a prefix would encompass all regular or IPv6 Address Specific RTs assigned by a given Global Administrator. Semantics of advertising Route Target Membership for other types of RTs as prefixes MUST be defined with the specification of those types of RTs.

3. Security Considerations

This document does not change security aspects as discussed in [RFC4684].

4. IANA Considerations

This document requests IANA to assign a new SAFI "Extended Route Target constrains".
