Definitions of Managed Objects for Bridges

Status of This Memo

   This document specifies an Internet standards track protocol for the
   Internet community, and requests discussion and suggestions for
   improvements. Please refer to the current edition of the "Internet
   Official Protocol Standards" (STD 1) for the standardization state
   and status of this protocol. Distribution of this memo is unlimited.

Copyright Notice

Abstract

   This memo defines a portion of the Management Information Base (MIB)
   for use with network management protocols in TCP/IP-based internets.
   In particular, it defines objects for managing MAC bridges based on
   the IEEE 802.1D-1998 standard between Local Area Network (LAN)
   segments. Provisions are made for the support of transparent
   bridging. Provisions are also made so that these objects apply to
   bridges connected by subnetworks other than LAN segments.

   The MIB module presented in this memo is a translation of the
   BRIDGE-MIB defined in RFC 1493 to the SMIv2 syntax.

   This memo obsoletes RFC 1493.

Table of Contents

1. The Internet-Standard Management Framework

   For a detailed overview of the documents that describe the current
   Internet-Standard Management Framework, please refer to section 7 of
   RFC 3410 [RFC3410].

   Managed objects are accessed via a virtual information store, termed
   the Management Information Base or MIB. MIB objects are generally
   accessed through the Simple Network Management Protocol (SNMP).
   Objects in the MIB are defined using the mechanisms defined in the
   Structure of Management Information (SMI). This memo specifies a MIB
   module that is compliant to the SMIv2, which is described in STD 58,
   RFC 2578 [RFC2578], STD 58, RFC 2579 [RFC2579] and STD 58, RFC 2580
   [RFC2580].

2. Conventions

   The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT",
   "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and
   "OPTIONAL", when they appear in this document, are to be interpreted
   as described in BCP 14, RFC 2119 [RFC2119].

3. Overview

   A common device present in many networks is the Bridge. This device
   is used to connect Local Area Network segments below the network
   layer.

   There are two major modes defined for this bridging: transparent and
   source route. The transparent method of bridging is defined in the
   IEEE 802.1D specification [IEEE8021D]. This memo defines those
   objects needed for the management of a bridging entity that operates
   in the transparent mode, as well as some objects that apply to all
   types of bridges.

   To be consistent with IAB directives and good engineering practices,
   an explicit attempt was made to keep this MIB module as simple as
   possible. This was accomplished by applying the following criteria
   to objects proposed for inclusion:

   1. Start with a small set of essential objects and add only as
      further objects are needed.

   2. Require that objects be essential for either fault or
      configuration management.

   3. Consider evidence of current use and/or utility.

   4. Limit the total number of objects.

   5. Exclude objects that are simply derivable from others in this or
      other MIB modules.

   6. Avoid causing critical sections to be heavily instrumented. The
      guideline that was followed is one counter per critical section
      per layer.

3.1 Structure of the MIB Module

   Objects in this MIB module are arranged into subtrees. Each subtree
   is organized as a set of related objects. The overall structure and
   assignment of objects to their subtrees is shown below. Where
   appropriate, the corresponding IEEE 802.1D [IEEE8021D] management
   object name is also included.

The following IEEE 802.1D management objects have not been included
in the BRIDGE-MIB module for the indicated reasons.

```
IEEE 802.1D Object              Disposition

Bridge.BridgeName               Same as sysDescr (SNMPv2-MIB)
Bridge.BridgeUpTime             Same as sysUpTime (SNMPv2-MIB)
Bridge.PortAddresses            Same as ifPhysAddress (IF-MIB)
BridgePort.PortName             Same as ifDescr (IF-MIB)
BridgePort.PortType             Same as ifType (IF-MIB)
BridgePort.RoutingType          Derivable from the implemented
                                subtrees

SpanningTreeProtocol
     .BridgeIdentifier          Combination of dot1dStpPriority
                                and dot1dBaseBridgeAddress
     .TopologyChange            Since this is transitory, it
                                is not considered useful.
SpanningTreeProtocolPort
     .Uptime                    Same as ifLastChange (IF-MIB)
     .PortIdentifier            Combination of dot1dStpPort
                                and dot1dStpPortPriority
     .TopologyChangeAcknowledged Since this is transitory, it
                                is not considered useful.
     .DiscardLackOfBuffers      Redundant
```

       Transmission Priority   These objects are not required
                                       as per the Pics Proforma and
                                       are not considered useful.
            .TransmissionPriorityName
            .OutboundUserPriority
            .OutboundAccessPriority

3.1.1 The dot1dBase Subtree

   This subtree contains the objects that are applicable to all types of
   bridges.

3.1.2 The dot1dStp Subtree

   This subtree contains the objects that denote the bridge's state with
   respect to the Spanning Tree Protocol. If a node does not implement
   the Spanning Tree Protocol, this subtree will not be implemented.

3.1.3 The dot1dSr Subtree

   This subtree contains the objects that describe the entity's state
   with respect to source route bridging. This subtree described in RFC
   1525 [RFC1525] is applicable only to source route bridging.

3.1.4 The dot1dTp Subtree

   This subtree contains objects that describe the entity's state with
   respect to transparent bridging. If transparent bridging is not
   supported, this subtree will not be implemented. This subtree is
   applicable to transparent-only and SRT bridges.

3.1.5 The dot1dStatic Subtree

   This subtree contains objects that describe the entity's state with
   respect to destination-address filtering. If destination-address
   filtering is not supported, this subtree will not be implemented.
   This subtree is applicable to any type of bridge that performs
   destination-address filtering.

3.2 Relationship to Other MIB Modules

   As described above, some IEEE 802.1D management objects have not been
   included in this MIB module because they overlap with objects in
   other MIB modules that are applicable to a bridge implementing this
   MIB module.

3.2.1 Relationship to the SNMPv2-MIB

The SNMPv2-MIB [RFC3418] defines objects that are generally
applicable to managed devices. These objects apply to the device as
a whole, irrespective of whether the device's sole functionality is
bridging, or whether bridging is only a subset of the device's
functionality.

As explained in Section 3.1, full support for the 802.1D management
objects requires that the SNMPv2-MIB objects sysDescr and sysUpTime
be implemented. Note that compliance with the current SNMPv2-MIB
module requires additional objects and notifications to be
implemented, as specified in RFC 3418 [RFC3418].

3.2.2 Relationship to the IF-MIB

The IF-MIB [RFC2863] defines managed objects for managing network
interfaces. A network interface is thought of as being attached to a
`subnetwork'. Note that this term is not to be confused with
`subnet', which refers to an addressing partitioning scheme used in
the Internet suite of protocols. The term 'segment' is used in this
memo to refer to such a subnetwork, whether it be an Ethernet
segment, a 'ring', a WAN link, or even an X.25 virtual circuit.

As explained in Section 3.1, full support for the 802.1D management
objects requires that the IF-MIB objects ifIndex, ifType, ifDescr,
ifPhysAddress, and ifLastChange are implemented. Note that
compliance to the current IF-MIB module requires additional objects
and notifications to be implemented as specified in RFC 2863
[RFC2863].

Implicit in this BRIDGE-MIB is the notion of ports on a bridge. Each
of these ports is associated with one interface of the 'interfaces'
subtree, and in most situations, each port is associated with a
different interface. However, there are situations in which multiple
ports are associated with the same interface. An example of such a
situation would be several ports, each corresponding, one-to-one,
with several X.25 virtual circuits that are all on the same
interface.

Each port is uniquely identified by a port number. A port number has
no mandatory relationship to an interface number, but in the simple
case, a port number will have the same value as the corresponding
interface's interface number. Port numbers are in the range
(1..dot1dBaseNumPorts).

Some entities perform other functionalities as well as bridging
through the sending and receiving of data on their interfaces. In
such situations, only a subset of the data sent/received on an
interface is within the domain of the entity's bridging
functionality. This subset is considered to be delineated according
to a set of protocols, with some protocols being bridged, and other
protocols not being bridged. For example, in an entity that
exclusively performs bridging, all protocols would be considered as
bridged, whereas in an entity that performs IP routing on IP
datagrams and only bridges other protocols, only the non-IP data
would be considered as having been bridged.

Thus, this BRIDGE-MIB (and in particular, its counters) are
applicable only to that subset of the data on an entity's interfaces
that is sent/received for a protocol being bridged. All such data is
sent/received via the ports of the bridge.

        DESCRIPTION
            "The Bridge MIB module for managing devices that support
            IEEE 802.1D.

            Copyright (C) The Internet Society (2005). This version of
            this MIB module is part of [RFC 4188](#); see the RFC itself for
            full legal notices."
        REVISION   "200509190000Z"
        DESCRIPTION
            "Third revision, published as part of [RFC 4188](#).

            The MIB module has been converted to SMIv2 format.
            Conformance statements have been added and some
            description and reference clauses have been updated.

            The object dot1dStpPortPathCost32 was added to
            support IEEE 802.1t and the permissible values of
            dot1dStpPriority and dot1dStpPortPriority have been
            clarified for bridges supporting IEEE 802.1t or
            IEEE 802.1w.

            The interpretation of dot1dStpTimeSinceTopologyChange
            has been clarified for bridges supporting the Rapid
            Spanning Tree Protocol (RSTP)."

          STATUS      current
          DESCRIPTION
              "The Bridge-Identifier, as used in the Spanning Tree
              Protocol, to uniquely identify a bridge.  Its first two
              octets (in network byte order) contain a priority value,
              and its last 6 octets contain the MAC address used to
              refer to a bridge in a unique fashion (typically, the
              numerically smallest MAC address of all ports on the
              bridge)."
          SYNTAX      OCTET STRING (SIZE (8))

      Timeout ::= TEXTUAL-CONVENTION
          DISPLAY-HINT "d"
          STATUS      current
          DESCRIPTION
              "A Spanning Tree Protocol (STP) timer in units of 1/100
              seconds.  Several objects in this MIB module represent
              values of timers used by the Spanning Tree Protocol.
              In this MIB, these timers have values in units of
              hundredths of a second (i.e., 1/100 secs).

              These timers, when stored in a Spanning Tree Protocol's
              BPDU, are in units of 1/256 seconds.  Note, however, that
              802.1D-1998 specifies a settable granularity of no more
              than one second for these timers.  To avoid ambiguity,
              a conversion algorithm is defined below for converting
              between the different units, which ensures a timer's
              value is not distorted by multiple conversions.

              To convert a Timeout value into a value in units of
              1/256 seconds, the following algorithm should be used:

                  b = floor( (n * 256) / 100)

              where:
                  floor   =  quotient [ignore remainder]
                  n is the value in 1/100 second units
                  b is the value in 1/256 second units

              To convert the value from 1/256 second units back to
              1/100 seconds, the following algorithm should be used:

                  n = ceiling( (b * 100) / 256)

              where:
                  ceiling = quotient [if remainder is 0], or
                            quotient + 1 [if remainder is nonzero]
                  n is the value in 1/100 second units
```

              b is the value in 1/256 second units

         Note: it is important that the arithmetic operations are
         done in the order specified (i.e., multiply first,
         divide second)."

        SYNTAX   OCTET STRING (SIZE (0..512))
        MAX-ACCESS read-create
        STATUS   current
        DESCRIPTION
            "The set of ports to which frames received from a
            specific port and destined for a specific MAC address,
            are allowed to be forwarded. Each octet within the
            value of this object specifies a set of eight ports,
            with the first octet specifying ports 1 through 8, the
            second octet specifying ports 9 through 16, etc. Within
            each octet, the most significant bit represents the
            lowest numbered port, and the least significant bit
            represents the highest numbered port. Thus, each port
            of the bridge is represented by a single bit within the
            value of this object. If that bit has a value of '1',
            then that port is included in the set of ports; the port
            is not included if its bit has a value of '0'. (Note
            that the setting of the bit corresponding to the port
            from which a frame is received is irrelevant.) The
            default value of this object is a string of ones of
            appropriate length.

          The value of this object may exceed the required minimum
          maximum message size of some SNMP transport (484 bytes,
          in the case of SNMP over UDP, see [RFC 3417, section 3.2](#)).
          SNMP engines on bridges supporting a large number of
          ports must support appropriate maximum message sizes."

5. IANA Considerations

   The MIB module in this document uses the following IANA-assigned
   OBJECT IDENTIFIER values that are recorded in the SMI Numbers
   registry:

      Descriptor   OBJECT IDENTIFIER value
      ----------   -----------------------
      dot1dBridge   { mib-2 17 }

6. Security Considerations

   There are a number of management objects defined in this MIB module
   that have a MAX-ACCESS clause of read-write and/or read-create. Such
   objects may be considered sensitive or vulnerable in some network
   environments. The support for SET operations in a non-secure
   environment without proper protection can have a negative effect on
   network operations.

   Some of the readable objects in this MIB module (i.e., objects with a
   MAX-ACCESS other than not-accessible) may be considered sensitive or
   vulnerable in some network environments. It is thus important to
   control even GET and/or NOTIFY access to these objects and possibly
   to even encrypt the values of these objects when sending them over
   the network via SNMP.

   These are the tables and objects and their sensitivity/vulnerability:

   o The writable objects dot1dStpPriority, dot1dStpBridgeMaxAge,
      dot1dStpBridgeHelloTime, dot1dStpBridgeForwardDelay,
      dot1dStpPortPriority, dot1dStpPortEnable, dot1dStpPortPathCost,
      and dot1dStpPortPathCost32 influence the spanning tree protocol.
      Unauthorized write access to these objects can cause the spanning
      tree protocol to compute other default topologies or it can change
      the speed in which the spanning tree protocol reacts to failures.

   o The writable object dot1dTpAgingTime controls how fast
      dynamically-learned forwarding information is aged out. Setting
      this object to a large value may simplify forwarding table
      overflow attacks.

   o The writable dot1dStaticTable provides a filtering mechanism
      controlling to which ports frames originating from a specific
      source may be forwarded. Write access to this table can be used
      to turn provisioned filtering off or to add filters to prevent
      rightful use of the network.

o The readable objects defined in the BRIDGE-MIB module provide
   information about the topology of a bridged network and the
   attached active stations. The addresses listed in the
   dot1dTpFdbTable usually reveal information about the manufacturer
   of the MAC hardware, which can be useful information for mounting
   other specific attacks.

o The two notifications newRoot and topologyChange are emitted
   during spanning tree computation and may trigger management
   systems to inspect the status of bridges and to recompute internal
   topology information. Hence, forged notifications may cause
   management systems to perform unnecessary computations and to
   generate additional SNMP traffic directed to the bridges in a
   network. Therefore, forged notifications may be part of a denial
   of service attack.

SNMP versions prior to SNMPv3 did not include adequate security.
Even if the network itself is secure (for example by using IPSec),
even then, there is no control as to who on the secure network is
allowed to access and GET/SET (read/change/create/delete) the objects
in this MIB module.

It is RECOMMENDED that implementers consider the security features as
provided by the SNMPv3 framework (see [RFC3410], section 8),
including full support for the SNMPv3 cryptographic mechanisms (for
authentication and privacy).

Further, deployment of SNMP versions prior to SNMPv3 is NOT
RECOMMENDED. Instead, it is RECOMMENDED to deploy SNMPv3 and to
enable cryptographic security. It is then a customer/operator
responsibility to ensure that the SNMP entity giving access to an
instance of this MIB module is properly configured to give access to
the objects only to those principals (users) that have legitimate
rights to indeed GET or SET (change/create/delete) them.

7. Acknowledgements

The MIB module presented in this memo is a translation of the
BRIDGE-MIB defined in [RFC1493] to the SMIv2 syntax. The original
authors of the SMIv1 module were E. Decker, P. Langille, A.
Rijsinghani, and K. McCloghrie. Further acknowledgement is given to
the members of the original Bridge Working Group in [RFC1493].

This document was produced on behalf of the Bridge MIB Working Group
in the Operations and Management area of the Internet Engineering
Task Force. The editors wish to thank the members of the Bridge MIB
Working Group, especially Mike MacFadden, John Flick, and Bert
Visscher for their many comments and suggestions that improved this

effort. Juergen Schoenwaelder helped in finalizing the document for
publication.

[8](#). Contact Information

The original version of this document was the result of significant
work by four major contributors:

    E. Decker

    P. Langille

    A. Rijsinghan
    Accton Technology Corporation
    5 Mount Royal Ave
    Marlboro, MA 01752
    USA

    K. McCloghrie
    Cisco Systems, Inc.
    170 West Tasman Drive
    San Jose, CA 95134
    USA

The conversion to the SMIv2 format is based on work done by the
following two contributors:

    Kenyon C. Norseth
    L-3 Communications
    640 N. 2200 West
    Salt Lake City, Utah 84116-0850
    USA

    E. Bell
    3Com Europe Limited
    3Com Centre, Boundary Way
    Hemel Hempstead Herts. HP2 7YU
    UK

9. Changes from RFC 1493

   The following changes have been made from RFC 1493.

   1. Translated the MIB definitions to use SMIv2. This includes the
      introduction of conformance statements. ASN.1 type definitions
      have been converted into textual-conventions and several UNITS
      clauses were added.

   2. The object dot1dStpPortPathCost32 was added to support IEEE
      802.1t.

   3. Permissible values for dot1dStpPriority and dot1dStpPortPriority
      have been clarified for bridges supporting IEEE 802.1t or IEEE
      802.1w.

   4. Interpretation of dot1dStpTimeSinceTopologyChange has been
      clarified for bridges supporting the rapid spanning tree protocol
      (RSTP).

   5. Updated the introductory boilerplate text, the security
      considerations section, and the references to comply with the
      current IETF standards and guidelines.

   6. Updated references to point to newer IEEE 802.1d documents.

   7. Additions and clarifications in various description clauses.
