DHCPv6 Options for LWM2M bootstrap information  
draft-ietf-dhc-dhcpv6-lwm2m-bootstrap-options-00

Abstract

This document defines Dynamic Host Configuration Protocol and Dynamic Host Configuration Protocol version 6 (DHCPv6) Options for LWM2M client bootstrap information, which are used to carry Uniform Resource Locator of LWM2M bootstrap server and certificate that validates the public key presented by server.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on March 1, 2018.

## 1. Introduction

Light weight machine to machine (LWM2M) protocol is used to manage end device life cycle in machine to machine communication scenarios. LWM2M device bootstrap is an optional life cycle phase for devices to get needed information when starting up for first time. Information gathered during bootstrapping might include management server details and security certificates required to establish connectivity with management server. Information required to connect with bootstrap server might be hard coded during device manufacturing phase.

Hard coding configuration by device manufacturer forces device operator to use same configuration as hard coded. It is possible that reachability information of bootstrap server that is hard coded may be outdated and boot strap server reachability might fail during first use of device. In such cases connectivity with bootstrap server is possible only through device software upgrade.

## 2. Terminology

This document makes use of the following terms:

LWM2M: Lightweight Machine to Machine is a protocol from Open Mobile alliance for device management in M2M or Internet of Things scenarios

LWM2M bootstrap server: The server that provides LWM2M bootstrap interface which is used to optionally configure a LWM2M Client so that it can successfully register with a LWM2M management Server

LWM2M management server: The server that provides registration, device management and service enablement interface to manage a LWM2M client.

### 3. LWM2M bootstrap server information through DHC

LWM2M bootstrap server details like URI and security certificate can be collected during dynamic host configuration phase. DHCPv4 and DHCPv6 options can be extended to collect LWM2M bootstrap server information for IPv4 and IPv6 networks respectively. DHCPv4 or DHCPv6 client requests LWM2M bootstrap server URI and LWM2M server certificate using new options proposed in sections below

#### 3.1. DHCPv6 option for LWM2M bootstrap server URI

DHCPv6 option OPTION\_LWM2M\_BOOTSTRAP\_URI conveys URI through which LWM2M client can reach LWM2M bootstrap server reachable through IPv6 network. The format of LWM2M bootstrap server URI option is as shown below:

```

      0               1               2               3
      0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
+-----+-----+-----+-----+-----+-----+-----+-----+
| option-code |                               | option-len |
+-----+-----+-----+-----+-----+-----+-----+-----+
|                               LWM2M-bootstrap-URI
|                               ...
+-----+-----+-----+-----+-----+-----+-----+-----+

```

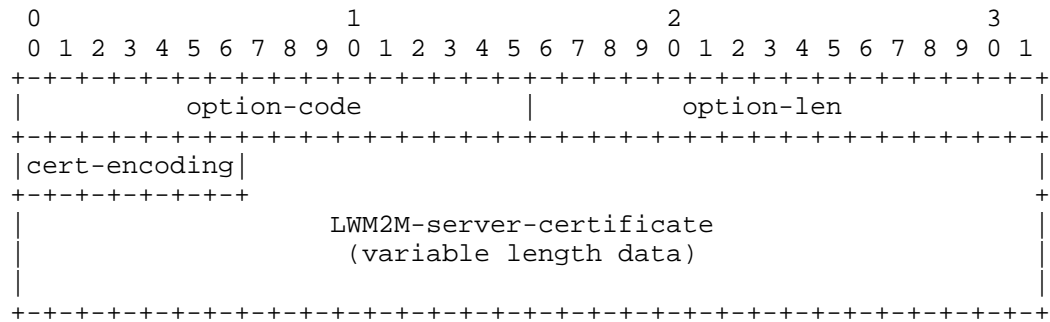

option-code: OPTION\_LWM2M\_BOOTSTRAP\_URI

option-len: Length of the 'LWM2M-bootstrap-URI' field in octets

LWM2M-bootstrap-URI: This string is URI of LWM2M bootstrap server. The string is not null-terminated.

### 3.2. DHCPv6 option for LWM2M server certificate

DHCPv6 option `OPTION_LWM2M_SERVER_CERTIFICATE` conveys security certificate which can be used by LWM2M client to establish secure connection with LWM2M server reachable through IPv6 network. The format of LWM2M server certificate option is as shown below:

option-code: `OPTION_LWM2M_SERVER_CERTIFICATE`

option-len: Length of the 'LWM2M-server-certificate' field in octets + 1

cert-encoding: This field indicates the type of certificate or certificate-related information contained in LWM2M-server-certificate field. See Section 4 for details.

LWM2M-server-certificate: Digital certificate of LWM2M server encoded according to cert-encoding. See Section 4 for details

### 3.3. DHCPv4 option for LWM2M bootstrap server URI

DHCPv4 option `OPTION_LWM2M_BOOTSTRAP_URI` conveys URI through which LWM2M client can reach LWM2M bootstrap server reachable through IPv4 network. The format of LWM2M bootstrap server URI option is as shown below:

Value	Certificate Encoding
0	Reserved
1	PKCS #7 wrapped X.509 certificate
2	PGP Certificate
3	DNS Signed Key
4	X.509 Certificate - Signature
5	Reserved
6	Kerberos Token
7	Certificate Revocation List (CRL)
8	Authority Revocation List (ARL)
9	SPKI Certificate
10	X.509 Certificate - Attribute
11	Raw RSA Key (DEPRECATED)
12	Hash and URL of X.509 certificate
13	Hash and URL of X.509 bundle
14	OCSF Content
15	Raw Public Key
16-200	Unassigned
201-255	Private use

## 5. Appearance of Option

### 5.1. Appearance of options in DHCPv6 control messages

The `OPTION_LWM2M_BOOTSTRAP_URI` and `OPTION_LWM2M_SERVER_CERTIFICATE` options MUST NOT appear in messages other than the following: SOLICIT (1), ADVERTISE (2), REQUEST (3), REPLY (4), RENEW (5), REBIND (6), INFORMATION-REQUEST (11). If this option appears in messages other than those specified above, the receiver MUST ignore it.

The option number for `OPTION_LWM2M_BOOTSTRAP_URI` and `OPTION_LWM2M_SERVER_CERTIFICATE` options MAY appear in the "Option Request" option [RFC3315] in the following messages: SOLICIT (1), REQUEST (3), RENEW (5), REBIND (6), INFORMATION-REQUEST (11) and RECONFIGURE (10). If this option number appears in the "Option Request" option in messages other than those specified above, the receiver SHOULD ignore it.

### 5.2. Appearance of options in DHCPv4 control messages

The `OPTION_LWM2M_BOOTSTRAP_URI` and `OPTION_LWM2M_SERVER_CERTIFICATE` options MUST NOT appear in messages other than the following: DHCPDISCOVER (1), DHCPOFFER (2), DHCPREQUEST (3), DHCPACK (5) and DHCPINFORM (8). If this option appears in messages other than those specified above, the receiver MUST ignore it.

The option number for `OPTION_LWM2M_BOOTSTRAP_URI` and `OPTION_LWM2M_SERVER_CERTIFICATE` options MAY appear in the "Parameter Request List" option [RFC2132] in the following messages: DHCPDISCOVER (1), DHCPOFFER (2), DHCPREQUEST (3), DHCPACK (5) and DHCPINFORM (8). If this option number appears in the "Parameter Request List" option in messages other than those specified above, the receiver SHOULD ignore it.

Maximum possible value of DHCPv4 "option-len" is 255. LWM2M-server-certificate MAY be of length more than 255. To accommodate larger certificate, DHCP server SHOULD follow encoding as mentioned in [RFC3396].

## 6. Configuration Guidelines for the Server

DHCPv4 or DHCPv6 server that supports `OPTION_LWM2M_BOOTSTRAP_URI` and `OPTION_LWM2M_SERVER_CERTIFICATE` SHOULD be configured with one and only one LWM2M bootstrap server URI, and one and only one certificate that validates bootstrap server's public key.

In the absence of URI configuration, DHCP server SHOULD ignore option `OPTION_LWM2M_BOOTSTRAP_URI`, and SHOULD continue processing of DHCP control message

In the absence of certificate configuration, DHCP server SHOULD ignore option `OPTION_LWM2M_SERVER_CERTIFICATE`, and SHOULD continue processing of DHCP control message

## 7. DHCPv4/DHCPv6 Client Behavior

DHCP or DHCPv6 client MAY decide need for inclusion of `OPTION_LWM2M_BOOTSTRAP_URI` and `OPTION_LWM2M_SERVER_CERTIFICATE` options in DHCPv4 or DHCPv6 control messages if device is capable of supporting LWM2M client functionality irrespective of state of LWM2M client. It is possible that LWM2M client MAY not be active before DHCPv4 or DHCPv6 message exchanges happens. In such scenario, DHCPv4 or DHCPv6 client MAY collect LWM2M bootstrap server URI and LWM2M server certificate and keep ready for LWM2M client initialization

DHCPv4 or DHCPv6 client MAY prefer collecting LWM2M bootstrap server URI and LWM2M server certificate by including `OPTION_LWM2M_BOOTSTRAP_URI` and `OPTION_LWM2M_SERVER_CERTIFICATE` options in DHCPINFORM or INFORMATION-REQUEST message which MAY be sent during LWM2M client initialization

LWM2M client devices running with IPv6 stack MAY use stateless auto address configuration to get IPv6 address. Such clients MAY use DHCPv6 INFORMATION-REQUEST to get LWM2M bootstrap URI and LWM2M

server server certificate through options `OPTION_LWM2M_BOOTSTRAP_URI` and `OPTION_LWM2M_SERVER_CERTIFICATE`

## 8. Relay agent Behavior

This draft does not impose any new requirements on DHCPv4 or DHCPv6 relay agent functionality

## 9. Security Considerations

`OPTION_LWM2M_BOOTSTRAP_URI` and `OPTION_LWM2M_SERVER_CERTIFICATE` options could be used by an intruder to advertise the URI of a malicious LWM2M bootstrap server and certificate and can alter the LWM2M management server details provided to LWM2M client. The consequences of such an attack can be critical, because any data that is reported by LWM2M client MAY reach unwanted LWM2M management server. As an example, an attacker could collect data from secure locations by deploying malicious servers.

To prevent these attacks, it is strongly advisable to secure the use of this option by either:

- o Using authenticated DHCP as described in [RFC3315], Section 21.
- o Using options `OPTION_LWM2M_BOOTSTRAP_URI` and `OPTION_LWM2M_SERVER_CERTIFICATE` only with trusted DHCP server

The security considerations documented in [RFC3315] are to be considered.

## 10. Acknowledgement

Particular thanks to A. Keraenen, J. Jimenez, J. Melen and S. Krishnan for the concept, inputs and review.

## 11. IANA Considerations

IANA is requested to assign new DHCPv6 option codes in the registry maintained in <http://www.iana.org/assignments/dhcpv6-parameters>:

Option Name	Value
<code>OPTION_LWM2M_BOOTSTRAP_URI</code>	TBA
<code>OPTION_LWM2M_SERVER_CERTIFICATE</code>	TBA

IANA is requested to assign new DHCPv4 option codes in the registry maintained in <http://www.iana.org/assignments/bootp-dhcp-parameters>:

Option Name	Value
OPTION_LWM2M_BOOTSTRAP_URI	TBA
OPTION_LWM2M_SERVER_CERTIFICATE	TBA

YANG Data Model for DHCPv6 Configuration  
draft-ietf-dhc-dhcpv6-yang-25

Abstract

This document describes YANG data modules for the configuration and management of DHCPv6 (Dynamic Host Configuration Protocol for IPv6 RFC8415) servers, relays, and clients.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

## 1. Introduction

DHCPv6 [RFC8415] is used for supplying configuration and other relevant parameters to clients in IPv6 networks. This document defines YANG [RFC7950] modules for the configuration and management of DHCPv6 'element' (servers, relays, and clients) using the Network Configuration Protocol (NETCONF [RFC6241]) or RESTCONF [RFC8040] protocols.

Separate modules are defined for each element. Additionally, a 'common' module contains typedefs and groupings used by all of the element modules. Appendix A provides XML examples for each of the element modules and shows their interaction.

The relay and client modules provide configuration which is applicable to devices' interfaces. This is done by importing the ietf-interfaces module [RFC8343] and using interface-refs to the relevant interface(s).

It is worth noting that as DHCPv6 is itself a client configuration protocol, it is not the intention of this document to provide a replacement for the allocation of DHCPv6 assigned addressing and parameters by using NETCONF/YANG. The DHCPv6 client module is intended for the configuration and monitoring of the DHCPv6 client function and does not replace DHCPv6 address and parameter configuration.

The YANG modules in this document adopt the Network Management Datastore Architecture (NMDA) [RFC8342].

### 1.1. Scope

[RFC8415] describes the current version of the DHCPv6 base protocol specification. A large number of additional specifications have also been published, extending DHCPv6 element functionality and adding new options. The YANG modules contained in this document do not attempt to capture all of these extensions and additions, rather to model the DHCPv6 functions and options covered in [RFC8415]. A focus has also been given on the extensibility of the modules so that they are easy to augment to add additional functionality as required by a particular implementation or deployment scenario.

### 1.2. Extensibility of the DHCPv6 Server YANG Module

The modules in this document only attempt to model DHCPv6-specific behavior and do not cover the configuration and management of functionality relevant for specific server implementations. The level of variance between implementations is too great to attempt to standardize them in a way that is useful without being restrictive.

However, it is recognized that implementation-specific configuration and management is also an essential part of DHCP deployment and operations. To resolve this, Appendix C contains an example YANG module for the configuration of implementation-specific functions, illustrating how this functionality can be augmented into the main 'ietf-dhcpv6-server.yang' module.

In DHCPv6, the concept of 'class selection' for messages received by the server is common. This is the identification and classification of messages based on a number of parameters so that the correct provisioning information can be supplied. For example, allocating a prefix from the correct pool, or supplying a set of options relevant for a specific vendor's client implementation. During the development of this document, implementations were researched and the findings were that while this function is common to all, the method for configuring and implementing this function differs greatly. Therefore, configuration of the class selection function has been omitted from the DHCPv6 server module to allow implementors to define their own suitable YANG modules. Appendix D provides an example of this, to demonstrate how this can be integrated with the main 'ietf-dhcpv6-server.yang' module.

### 1.2.1. DHCPv6 Option Definitions

A large number of DHCPv6 options have been created in addition to those defined in [RFC8415]. As implementations differ widely as to which DHCPv6 options they support, the following approach has been taken to defining options: Only the DHCPv6 options defined in [RFC8415] are included in this document.

Of these, only the options that require operator configuration are modeled. For example, OPTION\_IA\_NA (3) is created by the DHCP server when requested by the client. The contents of the fields in the option are based on a number of input configuration parameters which the server will apply when it receives the request (e.g., the T1/T2 timers that are relevant for the pool of addresses). As a result, there are no fields that are directly configurable for the option, so it is not modeled.

The following table shows the DHCPv6 options that are modeled, the element(s) they are modeled for, and the relevant YANG module name:

Name	Server	Relay	Client	Module Name
OPTION_ORO (6) Option Request Option			X	ietf-dhcpv6-client.yang
OPTION_PREFERENCE (7) Preference Option	X			ietf-dhcpv6-server.yang
OPTION_AUTH (11) Authentication Option	X	X		ietf-dhcpv6-common.yang
OPTION_UNICAST (12)	X			ietf-dhcpv6-server.yang

Server Unicast Option				
OPTION_RAPID_COMMIT (14) Rapid Commit Option	X		X	ietf-dhcpv6-common.yang
OPTION_USER_CLASS (15) User Class Option			X	ietf-dhcpv6-client.yang
OPTION_VENDOR_CLASS (16) Vendor Class Option			X	ietf-dhcpv6-client.yang
OPTION_VENDOR_OPTS (17) Vendor-specific Information Option	X		X	ietf-dhcpv6-common.yang
OPTION_INTERFACE_ID (18) Interface-Id Option		X		ietf-dhcpv6-relay.yang
OPTION_RECONF_MSG (19) Reconfigure Message Option	X			ietf-dhcpv6-server.yang
OPTION_RECONF_ACCEPT (20) Reconfigure Accept Option	X		X	ietf-dhcpv6-client.yang
OPTION_INFORMATION _REFRESH_TIME (32) Information Refresh Time Option	X			ietf-dhcpv6-server.yang
OPTION_SOL_MAX_RT (82) sol max rt Option	X			ietf-dhcpv6-server.yang
OPTION_INF_MAX_RT (83) inf max rt Option	X			ietf-dhcpv6-server.yang

Table 1: Modeled DHCPv6 Options

Further options definitions can be added using additional YANG modules via augmentation of the relevant element modules from this document. Appendix B contains an example module showing how the DHCPv6 option definitions can be extended in this manner. Some guidance on how to write YANG modules for additional DHCPv6 options is also provided.

### 1.3. Terminology

The reader should be familiar with the YANG data modeling language defined in [RFC7950].

The YANG modules in this document adopt the Network Management Datastore Architecture (NMDA) [RFC8342]. The meanings of the symbols used in tree diagrams are defined in [RFC8340].

The reader should be familiar with DHCPv6 relevant terminology as defined in [RFC8415] and other relevant documents.

## 2. Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

## 3. DHCPv6 Tree Diagrams

### 3.1. DHCPv6 Server Tree Diagram

The tree diagram in Figure 1 provides an overview of the DHCPv6 server module. The tree also includes the common functions module defined in Section 4.1.

```
module: ietf-dhcpv6-server
  +--rw dhcpv6-server
    +--rw enabled?                boolean

Figure 1: DHCPv6 Server Data Module Structure

## Descriptions of important nodes:

- \* **enabled:** Enables/disables the function of the DHCPv6 server.
- \* **dhcpv6-server:** This container holds the server's DHCPv6 specific configuration.
- \* **server-duid:** Each server must have a DUID (DHCP Unique Identifier) to identify itself to clients. A DUID consists of a two-octet type field and an arbitrary length (of no more than 128-octets) content field. Currently there are four DUID types defined in [RFC8415] and [RFC6355]. The DUID may be configured using the format for one of these types, or using the 'unstructured' format. The DUID type definitions are imported from the 'ietf-dhcpv6-common.yang' module. [IANA-HARDWARE-TYPES] and [IANA-PEN] are referenced for the relevant DUID types.
- \* **vendor-config:** This container is provided as a location for additional implementation-specific YANG nodes for the configuration of the device to be augmented. See Appendix C for an example of such a module.

- \* **option-sets:** The server can be configured with multiple option-sets. These are groups of DHCPv6 options with common parameters which will be supplied to clients on request. The 'option-set-id' field is used to reference an option-set elsewhere in the server's configuration.
- \* **option-set:** Holds configuration parameters for DHCPv6 options. The initial set of applicable option definitions are defined here and additional options that are also relevant to the relay and/or client are imported from the 'ietf-dhcpv6-common' module. Where needed, other DHCPv6 option modules can be augmented as they are defined.
- \* **class-selector:** This is provided as a location for additional implementation specific YANG nodes for vendor specific class selector nodes to be augmented. See Appendix D for an example of this.
- \* **allocation-ranges:** A hierarchical model is used for the allocation of addresses and prefixes. The top level 'allocation-ranges' container holds global configuration parameters. Under this, the 'allocation-range' list is used for specifying IPv6 prefixes and additional, prefix specific parameters.
- \* **address-pools:** Used for IA\_NA and IA\_TA pool allocations with a container for defining host reservations. State information about active leases from each pool is also located here.
- \* **prefix-pools:** Defines pools to be used for prefix delegation to clients. Static host reservations can also be configured. As prefix delegation is not supported by all DHCPv6 server implementations, it is enabled by a feature statement.

#### Information about RPCs

- \* **delete-address-lease:** Allows the deletion of a lease for an individual IPv6 address from the server's lease database.
- \* **delete-prefix-lease:** Allows the deletion of a lease for an individual IPv6 prefix from the server's lease database.

#### Information about notifications:

- \* **address/prefix-pool-utilization-threshold-exceeded:** Raised when the number of leased addresses or prefixes in a pool exceeds the configured usage threshold.

- \* `invalid-client-detected`: Raised when the server detects an invalid client. A description of the error and message type that has generated the notification can be included.
- \* `decline-received`: Raised when a DHCPv6 Decline message is received from a client.
- \* `non-success-code-sent`: Raised when there is a status message for a failure.

### 3.2. DHCPv6 Relay Tree Diagram

The tree diagram in Figure 2 provides an overview of the DHCPv6 relay module. The tree also includes the common functions module defined in Section 4.1.

The RPCs in the module are taken from requirements defined in [RFC8987].

```

module: ietf-dhcpv6-relay
  +--rw dhcpv6-relay
    +--rw enabled?          boolean
    +--rw relay-if* [if-name]
      +--rw if-name          if:interface-ref

    +--ro last-ipv6-addr?  inet:ipv6-address

```

Figure 2: DHCPv6 Relay Data Module Structure

Descriptions of important nodes:

- \* **enabled:** Globally enables/disables all DHCPv6 relay functions.
- \* **dhcpv6-relay:** This container holds the relay's DHCPv6-specific configuration.
- \* **relay-if:** As a relay may have multiple client-facing interfaces, they are configured in a list. The if-name leaf is the key and is an interface-ref to the applicable interface defined by the 'ietf-interfaces' YANG module.
- \* **enabled:** Enables/disables all DHCPv6 relay functions for the specific interface.
- \* **destination-addresses:** Defines a list of IPv6 addresses that client messages will be relayed to. May include unicast or multicast addresses.
- \* **link-address:** Configures the value that the relay will put into the link-address field of Relay-Forward messages.
- \* **prefix-delegation:** As prefix delegation is not supported by all DHCPv6 relay implementations, it is enabled by this feature statement where required.

- \* **pd-leases:** Contains read-only nodes for holding information about active delegated prefix leases.
- \* **relay-options:** Holds configuration parameters for DHCPv6 options which can be sent by the relay. The initial set of applicable option definitions are defined here and additional options that are also relevant to the server and/or client are imported from the 'ietf-dhcpv6-common' module. Where needed, other DHCPv6 option modules can be augmented as they are defined.

#### Information about RPCs

- \* **clear-prefix-entry:** Allows the removal of a delegated lease entry from the relay.
- \* **clear-client-prefixes:** Allows the removal of all of the delegated lease entries for a single client (referenced by client DUID) from the relay.
- \* **clear-interface-prefixes:** Allows the removal of all of the delegated lease entries from an interface on the relay.

#### Information about notifications:

- \* **topology-change:** Raised when the topology of the relay agent is changed, e.g., a client facing interface is reconfigured.

### 3.3. DHCPv6 Client Tree Diagram

The tree diagram in Figure 3 provides an overview of the DHCPv6 client module. The tree also includes the common functions module defined in Section 4.1.

```

Figure 3: DHCPv6 Client Data Module Structure

Descriptions of important nodes:

- \* **enabled:** Globally enables/disables all DHCPv6 client functions.
- \* **dhcpv6-client:** This container holds the client's DHCPv6 specific configuration.
- \* **client-if:** As a client may have multiple interfaces requesting configuration over DHCP, they are configured in a list. The if-name leaf is the key and is an interface-ref to the applicable interface defined by the 'ietf-interfaces' YANG module.
- \* **enabled:** Enables/disables all DHCPv6 client function for the specific interface.

- \* `client-duid/interface-duid`: The DUID (DHCP Unique Identifier) is used to identify the client to servers and relays. A DUID consists of a two-octet type field and an arbitrary length (1-128 octets) content field. Currently there are four DUID types defined in [RFC8415] and [RFC6355]. The DUID may be configured using the format for one of these types, or using the 'unstructured' format. The DUID type definitions are imported from the 'ietf-dhcpv6-common.yang' module. [IANA-HARDWARE-TYPES] and [IANA-PEN] are referenced for the relevant DUID types. A DUID only needs to be configured if the client is requesting addresses and/or prefixes from the server. Presence of the 'client-duid' or 'interface-duid' leaves is conditional on at least one of the 'non-temp-addr', 'temp-addr', or 'prefix-delegation' features being enabled. Additionally, if the 'anon-profile' [RFC7844] feature is enabled, a unique DUID can be configured per DHCP enabled interface using the 'interface-duid' leaf, otherwise there is a global 'client-duid' leaf.
- \* `client-configured-options`: Holds configuration parameters for DHCPv6 options which can be sent by the client. The initial set of applicable option definitions are defined here and additional options that are also relevant to the relay and/or server are imported from the 'ietf-dhcpv6-common' module. Where needed, other DHCPv6 option modules can be augmented as they are defined.
- \* `ia-na, ia-ta, ia-pd`: Contains configuration nodes relevant for requesting one or more of each of the lease types. Read-only nodes related to the active leases for each type are also located here. As these lease types may not be supported by all DHCPv6 client implementations, they are enabled via individual feature statements. Stateless DHCP ([RFC8415] Section 6.1) is configured when all address and prefix features are disabled.

Information about notifications:

- \* `invalid-ia-detected`: Raised when the identity association of the client can be proved to be invalid. Possible conditions include: duplicated address, illegal address, etc.
- \* `retransmission-failed`: Raised when the retransmission mechanism defined in [RFC8415] has failed.

#### 4. DHCPv6 YANG Modules

##### 4.1. DHCPv6 Common YANG Module

This module imports typedefs from [RFC6991].

```
<CODE BEGINS> file "ietf-dhcpv6-common@2022-03-07.yang"

      range 1..100;
    }
    description
      "Threshold value in percent.";
  }

  typedef timer-seconds32 {
    type uint32;
    units "seconds";
    description
      "Timer value type, in seconds (32-bit range).";
  }

  typedef duid-base {
    type string {
      pattern '([0-9a-fA-F]{2}){3,130}';
    }
    description
      "Each DHCP server and client has a DUID (DHCP Unique
      Identifier). The DUID consists of a two-octet type field
      and an arbitrary length (1-128 octets) content field.
      The duid-base type is used by other duid types with
      additional pattern constraints.

      Currently, there are four defined types of DUIDs
      in RFC 8415 and RFC 6355 - DUID-LLT, DUID-EN, DUID-LL and
      DUID-UUID. DUID-unstructured represents DUIDs which do not
      follow any of the defined formats.

      Type 'string' is used to represent the hexadecimal DUID value
      so that pattern constraints can be applied.";
    reference "RFC 8415: Dynamic Host Configuration Protocol for
      IPv6 (DHCPv6), Section 11
      RFC 6355: Definition of the UUID-Based DHCPv6 Unique
      Identifier (DUID-UUID), Section 4";
  }

  typedef duid-llt {
    type duid-base {
      pattern '0001'
        + '[0-9a-fA-F]{12,}';
    }
  }
```

## description

"DUID type 1, based on Link-Layer Address Plus Time (DUID-LLT). Constructed with a 2-octet hardware type assigned by IANA, 4-octets containing the time the DUID is generated (represented in seconds since midnight (UTC), January 1, 2000, modulo  $2^{32}$ ), and a link-layer address. The address is encoded without separator characters. For example:

```
+-----+-----+-----+-----+
| 0001 | 0006 | 28490058 | 00005E005300 |
+-----+-----+-----+-----+
```

This example includes the 2-octet DUID type of 1 (0x01), the hardware type is 0x06 (IEEE Hardware Types) the creation time is 0x28490058 (constructed as described above). Finally, the link-layer address is 0x5E005300 (EUI-48 address 00-00-5E-00-53-00)";

}

## typedef duid-en {

```
  type duid-base {
    pattern '0002'
    + '[0-9a-fA-F]{8,}';
  }
```

## description

"DUID type 2, assigned by vendor based on Enterprise Number (DUID-EN). This DUID consists of the 4-octet vendor's registered Private Enterprise Number as maintained by IANA followed by a unique identifier assigned by the vendor. For example:

```
+-----+-----+-----+-----+
| 0002 | 00007ED9 | 0CC084D303000912 |
+-----+-----+-----+-----+
```

This example includes the 2-octet DUID type of 2 (0x02), 4-octets for the Enterprise Number (0x7ED9), followed by 8-octets of identifier data (0x0CC084D303000912).";

reference "RFC 8415: Dynamic Host Configuration Protocol for IPv6 (DHCPv6), Section 11.3

IANA 'Private Enterprise Numbers' registry.

<<https://www.iana.org/assignments/enterprise-numbers>>;

}

```

typedef duid-ll {
  type duid-base {
    pattern '0003'
      + '([0-9a-fA-F]){4,}';
  }
  description
    "DUID type 3, based on Link-Layer Address (DUID-LL).
    Constructed with a 2-octet hardware type assigned
    by IANA, and a link-layer address. The address is encoded
    without separator characters. For example:

    +-----+-----+-----+
    | 0003 | 0006 | 00005E005300 |
    +-----+-----+-----+

    This example includes the 2-octet DUID type of 3 (0x03), the
    hardware type is 0x06 (IEEE Hardware Types), and the
    link-layer address is 0x5E005300 (EUI-48 address
    00-00-5E-00-53-00)";
  reference "RFC 8415: Dynamic Host Configuration Protocol for
    IPv6 (DHCPv6), Section 11.4
    IANA 'Hardware Types' registry.
    <https://www.iana.org/assignments/arp-parameters>";
}

typedef duid-uuid {
  type duid-base {
    pattern '0004'
      + '[0-9a-fA-F]{32}';
  }
  description
    "DUID type 4, based on Universally Unique Identifier
    (DUID-UUID). This type of DUID consists of 16 octets
    containing a 128-bit UUID. For example:

    +-----+-----+-----+
    | 0004 | 9f03b182705747e38a1e422910078642 |
    +-----+-----+-----+

    This example includes the 2-octet DUID type of 4 (0x04), and
    the UUID 9f03b182-7057-47e3-8a1e-422910078642.";
  reference "RFC 8415: Dynamic Host Configuration Protocol for
    IPv6 (DHCPv6), Section 11.5
    RFC 6355: Definition of the UUID-Based DHCPv6 Unique
    Identifier (DUID-UUID)";
}

typedef duid-unstructured {

```

```

    type duid-base {
        pattern '(000[1-4].*)' {
            modifier invert-match;
        }
    }
    description
        "Used for DUIDs following any other formats than DUID
        types 1-4. For example:

        +-----+
        | 7b6a164d325946539dc540fb539bc430 |
        +-----+

        Here, an arbitrary 16-octet value is used. The only constraint
        placed on this is that the first 2-octets are not 0x01-0x04
        to avoid collision with the other defined DUID types
        (duid-llt, duid-en, duid-ll, or duid-uuid).";

```

## 5. Security Considerations

The YANG modules defined in this document are designed to be accessed via network management protocols such as NETCONF [RFC6241] or RESTCONF [RFC8040]. The lowest NETCONF layer is the secure transport layer, and the mandatory-to-implement secure transport is Secure Shell (SSH) [RFC6242]. The lowest RESTCONF layer is HTTPS, and the mandatory-to-implement secure transport is TLS [RFC8446].

The Network Configuration Access Control Model (NACM) [RFC8341] provides the means to restrict access for particular NETCONF or RESTCONF users to a preconfigured subset of all available NETCONF or RESTCONF protocol operations and content.

All data nodes defined in the YANG modules which can be created, modified, and deleted (i.e., config true, which is the default) are considered sensitive. Write operations (e.g., edit-config) to these data nodes without proper protection can have a negative effect on network operations.

The RPCs for deleting/clearing active address and prefix entries in the server and relay modules are particularly sensitive. These RPCs use 'nacm:default-deny-all'.

An attacker with read/write access to the DHCPv6 server can undertake various attacks, such as:

- \* Denial of service attacks, such as disabling the DHCP server service, or removing address/prefix pool configuration.
- \* Various attacks based on re-configuring the contents of DHCPv6 options, leading to several types of security or privacy threats. These options could redirect clients to services under an attacker's control. For example, changing the address of a DNS server supplied in a DHCP option to point to a rogue server.

An attacker sending DHCPv6 messages which cause the server to generate 'invalid-client-detected' and 'decline-received' notifications could be used as a DoS attack. Such an attack could be mitigated by the NETCONF client unsubscribing from the affected notifications.

An attacker with read/write access the DHCPv6 relay can undertake various attacks, such as:

- \* Denial of service attacks, based on disabling the DHCP relay function, or modifying the relay's "destination-address" to a non-existent address.
- \* Modifying the relay's "destination-address" to send messages to a rogue DHCPv6 server.
- \* Deleting information about a client's delegated prefix, causing a denial of service attack as traffic will no longer be routed to the client.

Some of the readable data nodes in this YANG module may be considered sensitive or vulnerable in some network environments. Therefore, it is important to control read access (e.g., via get, get-config, or notification) to these data nodes. These subtrees and data nodes can be misused to track the activity or fingerprint the device type of the host:

- \* Information the server holds about clients with active leases: (dhc6-srv/allocation-ranges/allocation-range/address-pools/address-pool/active-leases)

- \* Information the relay holds about clients with active leases:  
(dhc6-rly/relay-if/prefix-delegation/)

Information about a server's configured address and prefix pools may be used by an attacker for network reconnaissance [RFC7707]. The following subtrees and data nodes could be used for this purpose:

- \* Information about client address allocation ranges: (dhc6-srv/  
allocation-ranges/allocation-range/address-pools/ address-pool/  
pool-prefix)
- \* Information about client prefix allocation ranges: (dhc6-srv/  
allocation-ranges/allocation-range/prefix-pools/ prefix-pool/pool-  
prefix)

[RFC7844] describes anonymity profiles for DHCP clients. These can be used to prevent client tracking on a visited network. Support for this can be enabled by implementing the 'anon-profile' feature in the client module.

[RFC7824] covers privacy considerations for DHCPv6 and is applicable here.

Security considerations related to DHCPv6 are discussed in [RFC8415].

Security considerations given in [RFC7950] are also applicable here.

## 6. IANA Considerations

This document registers four URIs and four YANG modules.

### 6.1. URI Registration

This document requests IANA to register the following four URIs in the "IETF XML Registry" [RFC3688]:

URI: urn:ietf:params:xml:ns:yang:ietf-dhcpv6-server  
Registrant Contact: The IESG.  
XML: N/A; the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns:yang:ietf-dhcpv6-relay  
Registrant Contact: The IESG.  
XML: N/A; the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns:yang:ietf-dhcpv6-client  
Registrant Contact: The IESG.  
XML: N/A; the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns:yang:ietf-dhcpv6-common  
Registrant Contact: The IESG.  
XML: N/A; the requested URI is an XML namespace.

## 6.2. YANG Module Name Registration

This document registers the following four YANG modules in the "YANG Module Names" registry [RFC6020].

name: ietf-dhcpv6-server  
namespace: urn:ietf:params:xml:ns:yang:ietf-dhcpv6-server  
prefix: dhc6-srv  
reference: RFC XXXX YANG Data Model for DHCPv6 Configuration

name: ietf-dhcpv6-relay  
namespace: urn:ietf:params:xml:ns:yang:ietf-dhcpv6-relay  
prefix: dhc6-rly  
reference: RFC XXXX YANG Data Model for DHCPv6 Configuration

name: ietf-dhcpv6-client  
namespace: urn:ietf:params:xml:ns:yang:ietf-dhcpv6-client  
prefix: dhc6-clnt  
reference: RFC XXXX YANG Data Model for DHCPv6 Configuration

name: ietf-dhcpv6-common  
namespace: urn:ietf:params:xml:ns:yang:ietf-dhcpv6-common  
prefix: dhc6  
reference: RFC XXXX YANG Data Model for DHCPv6 Configuration

## 7. Acknowledgments

The authors would like to thank Qi Sun, Lishan Li, Hao Wang, Tomek Mrugalski, Marcin Siodelski, Bernie Volz, Ted Lemon, Bing Liu, Tom Petch, Acee Lindem, and Benjamin Kaduk for their valuable comments and contributions to this work.

## Appendix A. Data Tree Examples

This section contains XML examples of data trees for the different DHCPv6 elements.

### A.1. DHCPv6 Server Configuration Examples

The following example shows a basic configuration for a server. The configuration defines:

- \* Enabling the DHCP server function.
- \* The server's DUID.
- \* An option set (id=1) with configuration for the Solicit Max Retry Timeout (SOL\_MAX\_RT (82)) option.
- \* A single network range (2001:db8::/32).
- \* A single address pool, with start and end addresses, relevant lease timers and an option-set-id of "1" referencing the option set configured above.

```
<dhcpv6-server
  xmlns="urn:ietf:params:xml:ns:yang:ietf-dhcpv6-server">
  <enabled>true</enabled>
  <server-duid>000200090CC084D303000912</server-duid>
  <vendor-config/>
  <option-sets>
    <option-set>
      <option-set-id>1</option-set-id>
      <description>Example DHCP option set</description>
      <sol-max-rt-option>
        <sol-max-rt-value>3600</sol-max-rt-value>
      </sol-max-rt-option>
    </option-set>
  </option-sets>
  <class-selector/>
  <allocation-ranges>
    <valid-lifetime>54000</valid-lifetime>
    <renew-time>7200</renew-time>
    <rebind-time>32400</rebind-time>
    <preferred-lifetime>43200</preferred-lifetime>
    <allocation-range>
      <id>1</id>
      <description>example-allocation-range</description>
      <network-prefix>2001:db8::/32</network-prefix>
      <option-set-id>1</option-set-id>
      <address-pools>
        <address-pool>
          <pool-id>1</pool-id>
          <pool-prefix>2001:db8:1:1::/64</pool-prefix>
          <start-address>2001:db8:1:1::1000</start-address>
          <end-address>2001:db8:1:1::2000</end-address>
          <max-address-utilization>50</max-address-utilization>
          <option-set-id>1</option-set-id>
        </address-pool>
      </address-pools>
    </allocation-range>
  </allocation-ranges>
</dhcpv6-server>
```

Figure 4: Basic Server Configuration Example XML

The following example configuration snippet shows a static host reservation within an address pool. The host's lease timers are configured to be longer than hosts from the pool with dynamically assigned addresses.

```
<address-pools>
  <address-pool>
    <pool-id>1</pool-id>
    <pool-prefix>2001:db8:1:1::/64</pool-prefix>
    <start-address>2001:db8:1:1::1000</start-address>
    <end-address>2001:db8:1:1::2000</end-address>
    <max-address-utilization>50</max-address-utilization>
    <option-set-id>1</option-set-id>
    <host-reservations>
      <host-reservation>
        <reserved-addr>2001:db8:1:1::1001</reserved-addr>
        <client-duid>00052001db81</client-duid>
        <option-set-id>1</option-set-id>
        <valid-lifetime>604800</valid-lifetime>
        <renew-time>86400</renew-time>
        <rebind-time>172800</rebind-time>
        <preferred-lifetime>345600</preferred-lifetime>
      </host-reservation>
    </host-reservations>
  </address-pool>
</address-pools>
```

Figure 5: Server Host Reservation Configuration Example XML Snippet

The following example configuration snippet shows a network range and pool to be used for delegating prefixes to clients. In this example, each client will receive a /56 prefix.

The 'max-pd-space-utilization' is set to 80 percent so that a 'prefix-pool-utilization-threshold-exceeded' notification will be raised if the number of prefix allocations exceeds this.

```
<allocation-ranges>
  <allocation-range>
    <id>1</id>
    <description>prefix-pool-example</description>
    <network-prefix>2001:db8::/32</network-prefix>
    <prefix-pools>
      <valid-lifetime>54000</valid-lifetime>
      <renew-time>7200</renew-time>
      <rebind-time>32400</rebind-time>
      <preferred-lifetime>43200</preferred-lifetime>
      <prefix-pool>
        <pool-id>0</pool-id>
        <option-set-id>1</option-set-id>
        <pool-prefix>2001:db8:1::/48</pool-prefix>
        <client-prefix-length>56</client-prefix-length>
        <max-pd-space-utilization>80</max-pd-space-utilization>
      </prefix-pool>
    </prefix-pools>
  </allocation-range>
</allocation-ranges>
```

Figure 6: Server Prefix Delegation Configuration Example XML Snippet

The next example configuration snippet shows a set of options that may be returned to clients, depending on the contents of a received DHCP request message. The option set ID is '1', which will be referenced by other places in the configuration (e.g., address pool configuration) as the available options for clients that request them.

The example shows how the option definitions can be extended via augmentation. In this case, "OPTION\_SIP\_SERVER\_D (21) SIP Servers Domain-Name List" from the example module in Appendix B has been augmented to the server's option set.

```

<option-sets>
  <option-set>
    <option-set-id>1</option-set-id>
    <description>Example DHCP option set</description>
    <vendor-specific-information-options>
      <vendor-specific-information-option>

      </sip-server>
      <sip-server>
        <sip-serv-id>1</sip-serv-id>
        <sip-serv-domain-name>sip2.example.org</sip-serv-domain-name>
      </sip-server>
    </sip-server-domain-name-list-option>
  </option-set>
</option-sets>

```

Figure 7: Server Option Set Configuration Example XML Snippet

#### A.2. DHCPv6 Relay Configuration Example

The following example shows a basic configuration for a single DHCP relay interface and its interaction with the ietf-interfaces module. The configuration shows two XML documents, one for ietf-interfaces and a second for ietf-dhcpv6-relay, defining:

- \* Configuring an interface using the ietf-interfaces module that the relay configuration will be applied to.
- \* Enabling the DHCP relay function globally and for the relevant interface.

- \* Referencing the interface that the relay configuration is relevant for via an interface-ref to the ietf-interfaces module.
- \* Defining two destination addresses that incoming DHCP messages will be relayed to.
- \* Configures the link-address value that will be sent in the relay-forward message.
- \* Configuring a value for the Interface ID Option (OPTION\_INTERFACE\_ID (18)), which will be included in the relay forward message.

```

<interfaces xmlns="urn:ietf:params:xml:ns:yang:ietf-interfaces"
  xmlns:ianaift="urn:ietf:params:xml:ns:yang:iana-if-type">
  <interface>
    <name>eth0</name>

```

Figure 8: Basic Relay Configuration Example XML

### A.3. DHCPv6 Client Configuration Example

The following example shows a basic configuration for a DHCP client and its interaction with the ietf-interfaces module. The configuration shows two XML documents, one for ietf-interfaces and a second for ietf-dhcpv6-client defining:

- \* Configuring an interface using the ietf-interfaces module that the client configuration will be applied to.
- \* Enabling the DHCP client function globally and for the relevant interface.
- \* References the interface that the client configuration is relevant for via an interface-ref to the ietf-interfaces module.
- \* Sets the DUID for the DHCPv6 enabled interface.
- \* Configures a list of option codes that will be requested by the client in its Option Request Option (OPTION\_ORO (5)).
- \* Configures a single instance of the Vendor-specific Information Option (OPTION\_VENDOR\_OPTS (17)) with a single sub-option data item.
- \* Requests a non-temporary IPv6 address (IA\_NA) with an identity association interface identifier of 1.
- \* Requests an IPv6 delegated prefix address (IA\_PD) with an identity association interface identifier of 2.

```
<interfaces xmlns="urn:ietf:params:xml:ns:yang:ietf-interfaces"
  xmlns:ianaift="urn:ietf:params:xml:ns:yang:iana-if-type">
  <interface>
    <name>eth0</name>
    <type>ianaift:ethernetCsmacd</type>
    <description>DHCPv6 Relay Interface</description>
    <enabled>true</enabled>
  </interface>
</interfaces>

<dhcpv6-client
  xmlns="urn:ietf:params:xml:ns:yang:ietf-dhcpv6-client">
  <enabled>true</enabled>

      <ia-id>2</ia-id>
    </ia-pd>
  </client-if>
</dhcpv6-client>
```

Figure 9: Basic Client Configuration Example XML

## Appendix B. Example of Augmenting Additional DHCPv6 Option Definitions

The following section provides an example of how the DHCPv6 option definitions can be extended to include additional options. It is expected that additional specification documents will be published for this in the future.

The example defines YANG models for `OPTION_SIP_SERVER_D` (21) and `OPTION_SIP_SERVER_D` (22) defined in [RFC3319]. Example XML configuration, showing the interworking with other modules is provided in Figure 7.

The module is constructed as follows:

- \* The module is named using a meaningful, shortened version of the document name in which the DHCP option format is specified.
- \* A separate grouping is used to define each option.
- \* The name of the option is taken from the registered IANA name for the option, with an '-option' suffix added.
- \* The description field is taken from the relevant option code name and number.
- \* The reference section is the number and name of the RFC in which the DHCPv6 option is defined.
- \* The remaining fields match the fields in the DHCP option. They are in the same order as defined in the DHCP option. Where-ever possible, the format that is defined for the DHCP field should be matched by the relevant YANG type.
- \* Fields which can have multiple entries or instances are defined using list or leaf-list nodes.

Below the groupings for option definitions, augment statements are used to add the option definitions for use in the relevant DHCP element's module (server, relay and/or client).

```
module example-dhcpv6-opt-sip-serv {  
  yang-version 1.1;  
  namespace "https://example.com/ns/" +  
    "example-dhcpv6-opt-sip-serv";  
  prefix "sip-srv";  
  
  import ietf-inet-types {  
    prefix inet;  
  }
```

```
}

        description
          "SIP server list entry identifier.";
      }
      leaf sip-serv-addr {
```

```

        type inet:ipv6-address;
        description
            "SIP server IPv6 address.";
    }
}
}
}

/*
 * Augmentations
 */

augment "/dhc6-srv:dhcpv6-server/dhc6-srv:option-sets/" +
    "dhc6-srv:option-set" {
    description
        "Augment the option definition groupings to the server
        module.";
    uses sip-server-domain-name-list-option-group;
    uses sip-server-address-list-option-group;
}
}

```

The correct location to augment the new option definition(s) will vary according to the specific rules defined for the use of that specific option. For example, for options which will be augmented into the ietf-dhcpv6-server module, in many cases, these will be augmented to:

```
'/dhc6-srv:dhc6-srv/dhc6-srv:option-sets/dhc6-srv:option-set'
```

So that they can be defined within option sets. However, there are some options which are only applicable for specific deployment scenarios and in these cases it may be more logical to augment the option group to a location relevant for the option.

One example for this could be OPTION\_PD\_EXCLUDE (67). This option is only relevant in combination with a delegated prefix which contains a specific prefix. In this case, the following location for the augmentation may be more suitable:

```
'/dhc6-srv:dhc6-srv/dhc6-srv:allocation-ranges/dhc6-srv:allocation-
range/dhc6-srv:prefix-pools/dhc6-srv:prefix-pool'
```

#### Appendix C. Example Vendor Specific Server Configuration Module

This section shows how to extend the server YANG module defined in this document with vendor specific configuration nodes, e.g., configuring access to a lease storage database.

The example module defines additional server attributes such as name and description. Storage for leases is configured using a lease-storage container. It allows storing leases in one of three options: memory (memfile), MySQL and PostgreSQL. For each case, the necessary configuration parameters are provided.

For simplicity, this example module assumes that the DHCPv6 server is colocated with the MySQL or PostgreSQL database server and can serve traffic securely on the localhost without additional cryptographic protection. In a production deployment, these functions would likely not be colocated and thus use TLS to secure the database connection between the DHCPv6 server and database server. A YANG module for configuring TLS is defined in [I-D.ietf-netconf-tls-client-server].

At the end there is an augment statement which adds the vendor specific configuration defined in "dhcpv6-server-config:config" under the "/dhcpv6-server:config/dhcpv6-server:vendor-config" mount point.

```
module example-dhcpv6-server-conf {
  yang-version 1.1;
  namespace "https://example.com/ns/" +
    "example-dhcpv6-server-conf";
  prefix "dhc6-srv-conf";

  import ietf-inet-types {
    prefix inet;
  }

  import ietf-interfaces {
    prefix if;
  }

  import ietf-dhcpv6-server {
    prefix dhc6-srv;
  }

## Appendix D. Example definition of class-selector configuration

The module "ietf-example-dhcpv6-class-selector" provides an example of how vendor-specific class selection configuration can be modeled and integrated with the "ietf-dhcpv6-server" module defined in this document.

The example module defines "client-class-names" with associated matching rules. A client can be classified based on "client-id", "interface-id" (ingress interface of the client's messages), packet's source or destination address, relay link address, relay link interface-id and more. Actually, there are endless methods for classifying clients. So this standard does not try to provide full specification for class selection, it only shows an example of how it could be defined.

At the end of the example augment statements are used to add the defined class selector rules into the overall DHCPv6 addressing hierarchy. This is done in two main parts:

- \* The augmented class-selector configuration in the main DHCPv6 Server configuration.

- \* client-class leafrefs augmented to "allocation-range", "address-pool" and "pd-pool", pointing to the "client-class-name" that is required.

The mechanism is as follows: class is associated to client based on rules and then client is allowed to get address(es)/prefix(es) from a given allocation-range/pool if the class name matches.

```
module example-dhcpv6-class-select {
  yang-version 1.1;
  namespace "https://example.com/ns/" +
    "example-dhcpv6-class-select";
  prefix "dhc6-class-sel";

DHCPv6 options for MQTT client configuration  
draft-nalluri-dhc-dhcpv6-mqtt-config-options-00

Abstract

This document defines Dynamic Host Configuration Protocol and Dynamic Host Configuration Protocol version 6 (DHCPv6) Options for MQTT client configuration information, which are used to carry Uniform Resource Locator of MQTT broker and MQTT topic prefix that should be used as prefix for any topic published by MQTT client.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on April 23, 2018.

## 1. Introduction

The Message Queue Telemetry Transport (MQTT) protocol is a light-weight IoT protocol, based on the publish/subscribe communication model. MQTT clients, that can be publishers or subscribers, communicate with each other via a broker. The broker hosts a set of "topics" and clients can publish and subscribe to these topics. All data published to a topic is delivered to all clients who are subscribed to the same topic. In communications network using MQTT clients commonly use a preconfigured address information, such as Uniform Resource Identifier (URI), to register with a MQTT broker. The URI might be configured by a user or an operator through a local device interface. Alternatively, the URI might be provided as a hardcoded value by manufacturer of the MQTT client device.

Hard coding configuration by device manufacturer forces device operator to use same configuration as hard coded. It is possible that reachability information of MQTT broker that is hard coded may be outdated and MQTT broker reachability might fail during first use of device. In such cases connectivity with MQTT broker is possible only through device software upgrade.

Subscribers who are interested in specific data of a specific topic registers the topic with the MQTT broker. MQTT clients acting as publishers register/create topics, and MQTT clients acting as subscribers register for a specific existing topic. In general

terms, a topic can be represented by a hierarchical string defined by MQTT service or device operator. Before operation every MQTT client that wishes to publish data on a specific topic should be aware of the corresponding hierarchical strings that are supposed to be used for the topics for the MQTT client to publish topic specific data.

However, uniqueness of topics in the MQTT network is not guaranteed as there is no standard guideline that guarantees uniqueness. In the same MQTT network, using the same MQTT broker, different MQTT clients can accidentally use the same topic to publish data, which results in invalid operation. In such scenarios, subscribers might receive wrong data and publishers may change data they were not supposed to change. Network or device operators therefore have to take care of the topic name space across the MQTT network so that topic identities are unique across the MQTT network. This manual operation is error-prone and costly.

This draft proposes DHCP and DHCPv6 options to dynamically configure MQTT client with MQTT broker URI and one or more topic prefixes to guarantee uniqueness of topic used across MQTT network.

## 2. MQTT client configuration through DHCP

MQTT broker URI and topic prefix can be collected during dynamic host configuration phase. DHCPv4 and DHCPv6 options can be extended to collect MQTT broker URI and MQTT topic prefix for IPv4 and IPv6 networks respectively. DHCPv4 or DHCPv6 client requests MQTT broker URI and MQTT topic prefix using new options proposed in sections below

### 2.1. DHCPv6 option for MQTT broker URI

DHCPv6 option `OPTION_MQTT_BROKER_URI` conveys URI through which MQTT client can reach MQTT broker in IPv6 network. The format of MQTT broker URI option is as shown below:

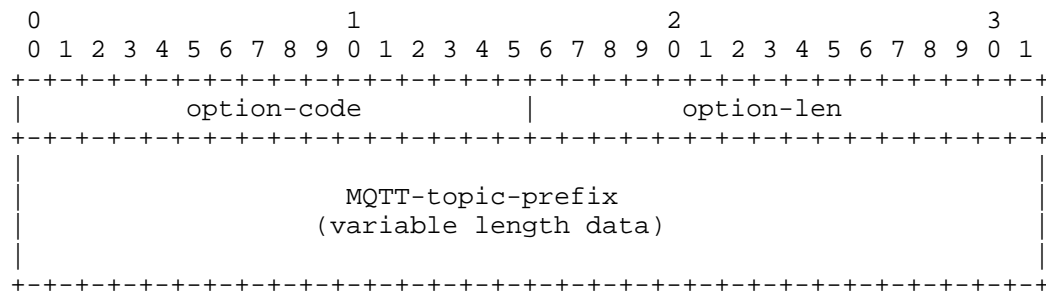

option-code: `OPTION_MQTT_BROKER_URI`

option-len: Length of the 'MQTT-broker-URI' field in octets

MQTT-broker-URI: This string is URI of MQTT broker. The string is not null-terminated.

## 2.2. DHCPv6 option for MQTT topic prefix

DHCPv6 option `OPTION_MQTT_TOPIC_PREFIX` conveys prefix string which can be used by MQTT client as prefix of each topic used for publishing data. The format of MQTT topic prefix option is as shown below:

option-code: `OPTION_MQTT_TOPIC_PREFIX`

option-len: Length of the 'MQTT-topic-prefix' field in octets

MQTT-topic-prefix: MQTT topic prefix string that can be used by MQTT client as prefix to each topic used for publishing data

## 2.3. DHCPv4 option for MQTT broker URI

DHCPv4 option `OPTION_MQTT_BROKER_URI` conveys URI through which MQTT client can reach MQTT broker that is reachable through IPv4 network. The format of MQTT broker URI option is as shown below:

option-code: `OPTION_MQTT_BROKER_URI`

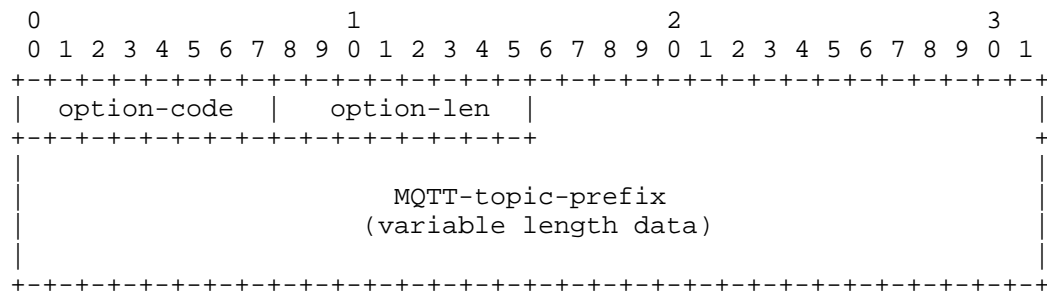

option-len: Length of the 'MQTT-broker-URI' field in octets

MQTT-broker-URI: This string is URI of MQTT broker. The string is not null-terminated.

#### 2.4. DHCPv4 option for MQTT topic prefix

DHCPv4 option OPTION\_MQTT\_TOPIC\_PREFIX conveys prefix string which can be used by MQTT client as prefix of each topic used for publishing data. The format of MQTT topic prefix option is as shown below:

option-code: OPTION\_MQTT\_TOPIC\_PREFIX

option-len: Length of the 'MQTT-topic-prefix' field in octets

MQTT-topic-prefix: MQTT topic prefix string that can be used by MQTT client as prefix to each topic used for publishing data

### 3. Appearance of Option

#### 3.1. Appearance of options in DHCPv6 control messages

The OPTION\_MQTT\_BROKER\_URI and OPTION\_MQTT\_TOPIC\_PREFIX options MUST NOT appear in messages other than the following: SOLICIT (1), ADVERTISE (2), REQUEST (3), REPLY (4), RENEW (5), REBIND (6), INFORMATION-REQUEST (11). If this option appears in messages other than those specified above, the receiver MUST ignore it.

The option number for OPTION\_MQTT\_BROKER\_URI and OPTION\_MQTT\_TOPIC\_PREFIX options MAY appear in the "Option Request" option [RFC3315] in the following messages: SOLICIT (1), REQUEST (3), RENEW (5), REBIND (6), INFORMATION-REQUEST (11) and RECONFIGURE (10). If this option number appears in the "Option Request" option in messages other than those specified above, the receiver SHOULD ignore it.

### 3.2. Appearance of options in DHCPv4 control messages

The `OPTION_MQTT_BROKER_URI` and `OPTION_MQTT_TOPIC_PREFIX` options MUST NOT appear in messages other than the following: DHCPDISCOVER (1), DHCPOFFER (2), DHCPREQUEST (3), DHCPACK (5) and DHCPINFORM (8). If this option appears in messages other than those specified above, the receiver MUST ignore it.

The option number for `OPTION_MQTT_BROKER_URI` and `OPTION_MQTT_TOPIC_PREFIX` options MAY appear in the "Parameter Request List" option [RFC2132] in the following messages: DHCPDISCOVER (1), DHCPOFFER (2), DHCPREQUEST (3), DHCPACK (5) and DHCPINFORM (8). If this option number appears in the "Parameter Request List" option in messages other than those specified above, the receiver SHOULD ignore it.

Maximum possible value of DHCPv4 "option-len" is 255. MQTT-topic-prefix MAY be of length more than 255. To accommodate larger certificate, DHCP server SHOULD follow encoding as mentioned in [RFC3396].

## 4. Configuration Guidelines for the Server

DHCPv4 or DHCPv6 server that supports `OPTION_MQTT_BROKER_URI` and `OPTION_MQTT_TOPIC_PREFIX` SHOULD be configured with one or more MQTT broker URI, and one or more topic prefix for each MQTT client. DHCP server may use statically configured topic prefixes or algorithm generated topic prefixes. Algorithms to generate MQTT topic prefix for an MQTT client might use client attributes like data link layer address. Details of algorithms to generate topic prefix and guidelines to manage topic prefixes are not included in the scope of this draft

In the absence of MQTT broker URI configuration, DHCP server SHOULD ignore option `OPTION_MQTT_BROKER_URI`, and SHOULD continue processing of DHCP control message

In the absence of MQTT topic prefix configuration and topic prefix generation algorithm, DHCP server SHOULD ignore option `OPTION_MQTT_TOPIC_PREFIX`, and SHOULD continue processing of DHCP control message

## 5. DHCPv4/DHCPv6 Client Behavior

DHCP or DHCPv6 client MAY decide need for inclusion of `OPTION_MQTT_BROKER_URI` and `OPTION_MQTT_TOPIC_PREFIX` options in DHCPv4 or DHCPv6 control messages if device is capable of supporting MQTT client functionality irrespective of state of MQTT client. It is

possible that MQTT client MAY not be active before DHCPv4 or DHCPv6 message exchanges happens. In such scenario, DHCPv4 or DHCPv6 client MAY collect MQTT broker URI and MQTT topic prefix and keep ready for MQTT client initialization

DHCPv4 or DHCPv6 client MAY prefer collecting MQTT broker URI and MQTT topic prefix by including `OPTION_MQTT_BROKER_URI` and `OPTION_MQTT_TOPIC_PREFIX` options in `DHCPINFORM` or `INFORMATION-REQUEST` message which MAY be send during MQTT client initialization

MQTT client devices running with IPv6 stack MAY use stateless auto address configuration to get IPv6 address. Such clients MAY use DHCPv6 `INFORMATION-REQUEST` to get MQTT broker URI and MQTT topic prefix through options `OPTION_MQTT_BROKER_URI` and `OPTION_MQTT_TOPIC_PREFIX`

## 6. Relay agent Behavior

This draft does not impose any new requirements on DHCPv4 or DHCPv6 relay agent functionality

## 7. Security Considerations

`OPTION_MQTT_BROKER_URI` option could be used by an intruder to advertise the URI of a malicious MQTT broker which results in data reporting by MQTT clients to an unwanted MQTT broker. As an example, an attacker could collect data from secure locations by deploying malicious servers.

Intuders might use `OPTION_MQTT_TOPIC_PREFIX` option to advertise unwanted topic prefixes which results in duplicate MQTT topics As an example, an attacker could collect data from secure locations by deploying malicious servers.

To prevent these attacks, it is strongly advisable to secure the use of these options by either:

- o Using authenticated DHCP as described in [RFC3315], Section 21.
- o Using options `OPTION_MQTT_BROKER_URI` and `OPTION_MQTT_TOPIC_PREFIX` only with trusted DHCP server

The security considerations documented in [RFC3315] are to be considered.

## 8. Acknowledgement

Particular thanks to A. Keraenen and S. Krishnan for inputs and review.

## 9. IANA Considerations

IANA is requested to assign new DHCPv6 option codes in the registry maintained in <http://www.iana.org/assignments/dhcpv6-parameters>:

Option Name	Value
OPTION_MQTT_BROKER_URI	TBA
OPTION_MQTT_TOPIC_PREFIX	TBA

IANA is requested to assign new DHCPv4 option codes in the registry maintained in <http://www.iana.org/assignments/bootp-dhcp-parameters>:

Option Name	Value
OPTION_MQTT_BROKER_URI	TBA
OPTION_MQTT_TOPIC_PREFIX	TBA
