A YANG Data Model for Routing Management (NMDA Version)
draft-ietf-netmod-rfc8022bis-11

Abstract

This document contains a specification of three YANG modules and one submodule. Together they form the core routing data model that serves as a framework for configuring and managing a routing subsystem. It is expected that these modules will be augmented by additional YANG modules defining data models for control-plane protocols, route filters, and other functions. The core routing data model provides common building blocks for such extensions -- routes, Routing Information Bases (RIBs), and control-plane protocols.

The YANG modules in this document conform to the Network Management Datastore Architecture (NMDA). This document obsoletes RFC 8022.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on July 30, 2018.

1. Introduction

This document contains a specification of the following YANG modules:

- o The "ietf-routing" module provides generic components of a routing data model.
- o The "ietf-ipv4-unicast-routing" module augments the "ietf-routing" module with additional data specific to IPv4 unicast.
- o The "ietf-ipv6-unicast-routing" module augments the "ietf-routing" module with additional data specific to IPv6 unicast. Its submodule "ietf-ipv6-router-advertisements" also augments the "ietf-interfaces" [I-D.ietf-netmod-rfc7223bis] and "ietf-ip" [I-D.ietf-netmod-rfc7277bis] modules with IPv6 router configuration variables required by [RFC4861].

These modules together define the so-called core routing data model, which is intended as a basis for future data model development covering more-sophisticated routing systems. While these three modules can be directly used for simple IP devices with static routing (see Appendix B), their main purpose is to provide essential building blocks for more-complicated data models involving multiple control-plane protocols, multicast routing, additional address families, and advanced functions such as route filtering or policy routing. To this end, it is expected that the core routing data model will be augmented by numerous modules developed by various IETF working groups.

The YANG modules in this document conform to the Network Management Datastore Architecture (NMDA) [I-D.ietf-netmod-revised-datastores]. This document obsoletes RFC 8022 [RFC8022].

2. Terminology and Notation

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

The following terms are defined in [I-D.ietf-netmod-revised-datastores]:

- o client
- o server

- o configuration
- o system state
- o operational state
- o intended configuration

The following terms are defined in [RFC7950]:

- o action
- o augment
- o container
- o container with presence
- o data model
- o data node
- o feature
- o leaf
- o list
- o mandatory node
- o module
- o schema tree
- o RPC (Remote Procedure Call) operation

2.1. Glossary of New Terms

core routing data model: YANG data model comprising "ietf-routing", "ietf-ipv4-unicast-routing", and "ietf-ipv6-unicast-routing" modules.

direct route: a route to a directly connected network.

Routing Information Base (RIB): An object containing a list of routes together with other information. See Section 5.2 for details.

system-controlled entry: An entry of a list in operational state ("config false") that is created by the system independently of what has been explicitly configured. See Section 4.1 for details.

user-controlled entry: An entry of a list in operational state ("config false") that is created and deleted as a direct consequence of certain configuration changes. See Section 4.1 for details.

2.2. Tree Diagrams

Tree diagrams used in this document follow the notation defined in [I-D.ietf-netmod-yang-tree-diagrams].

2.3. Prefixes in Data Node Names

In this document, names of data nodes, actions, and other data model objects are often used without a prefix, as long as it is clear from the context in which YANG module each name is defined. Otherwise, names are prefixed using the standard prefix associated with the corresponding YANG module, as shown in Table 1.

Prefix	YANG module	Reference
if	ietf-interfaces	[I-D.ietf-netmod-rfc7223bis]
ip	ietf-ip	[I-D.ietf-netmod-rfc7277bis]
rt	ietf-routing	Section 7
v4ur	ietf-ipv4-unicast-routing	Section 8
v6ur	ietf-ipv6-unicast-routing	Section 9
yang	ietf-yang-types	[RFC6991]
inet	ietf-inet-types	[RFC6991]

Table 1: Prefixes and Corresponding YANG Modules

3. Objectives

The initial design of the core routing data model was driven by the following objectives:

- o The data model should be suitable for the common address families -- in particular, IPv4 and IPv6 -- and for unicast and multicast routing, as well as Multiprotocol Label Switching (MPLS).
- o A simple IP routing system, such as one that uses only static routing, should be configurable in a simple way, ideally without any need to develop additional YANG modules.

- o On the other hand, the core routing framework must allow for complicated implementations involving multiple Routing Information Bases (RIBs) and multiple control-plane protocols, as well as controlled redistributions of routing information.
- o Because device vendors will want to map the data models built on this generic framework to their proprietary data models and configuration interfaces, the framework should be flexible enough to facilitate that and accommodate data models with different logic.

4. The Design of the Core Routing Data Model

The core routing data model consists of three YANG modules and one submodule. The first module, "ietf-routing", defines the generic components of a routing system. The other two modules, "ietf-ipv4-unicast-routing" and "ietf-ipv6-unicast-routing", augment the "ietf-routing" module with additional data nodes that are needed for IPv4 and IPv6 unicast routing, respectively. The "ietf-ipv6-unicast-routing" module has a submodule, "ietf-ipv6-router-advertisements", that augments the "ietf-interfaces" [I-D.ietf-netmod-rfc7223bis] and "ietf-ip" [I-D.ietf-netmod-rfc7277bis] modules with configuration variables for IPv6 router advertisements as required by [RFC4861].

Figure 1 shows abridged views of the hierarchies. See Appendix A for the complete data trees.

```

Figure 1: Data Hierarchy

As can be seen from Figure 1, the core routing data model introduces several generic components of a routing framework: routes, RIBs containing lists of routes, and control-plane protocols. Section 5 describes these components in more detail.

4.1. System-Controlled and User-Controlled List Entries

The core routing data model defines several lists in the schema tree, such as "rib", that have to be populated with at least one entry in any properly functioning device, and additional entries may be configured by a client.

In such a list, the server creates the required item as a so-called system-controlled entry in the operational state, i.e., inside read-only lists in the "routing" container.

An example can be seen in Appendix D: the `"/routing/ribs/rib"` list has two system-controlled entries named `"ipv4-master"` and `"ipv6-master"`.

Additional entries may be created in the configuration by a client, e.g., via the NETCONF protocol. These are so-called user-controlled entries. If the server accepts a configured user-controlled entry, then this entry also appears in the operational state version of the list.

Corresponding entries in both versions of the list (in the intended configuration and the operational state) [I-D.ietf-netmod-revised-datastores] have the same value of the list key.

A client may also provide supplemental configuration of system-controlled entries. To do so, the client creates a new entry in the configuration with the desired contents. In order to bind this entry to the corresponding entry in the operational state, the key of the configuration entry has to be set to the same value as the key of the operational state entry.

Deleting a user-controlled entry from the intended configuration results in the removal of the corresponding entry in the operational state list. In contrast, if client deletes a system-controlled entry from the intended configuration, only the extra configuration specified in that entry is removed but the corresponding operational state entry is not removed.

5. Basic Building Blocks

This section describes the essential components of the core routing data model.

5.1. Route

Routes are basic elements of information in a routing system. The core routing data model defines only the following minimal set of route attributes:

- o `"destination-prefix"`: address prefix specifying the set of destination addresses for which the route may be used. This attribute is mandatory.
- o `"route-preference"`: an integer value (also known as administrative distance) that is used for selecting a preferred route among routes with the same destination prefix. A lower value means a more preferred route.

- o "next-hop": determines the outgoing interface and/or next-hop address(es), or a special operation to be performed with a packet.

Routes are primarily system state that appear as entries of RIBs (Section 5.2) but they may also be found in configuration data, for example, as manually configured static routes. In the latter case, configurable route attributes are generally a subset of attributes defined for RIB routes.

5.2. Routing Information Base (RIB)

Every implementation of the core routing data model manages one or more Routing Information Bases (RIBs). A RIB is a list of routes complemented with administrative data. Each RIB contains only routes of one address family. An address family is represented by an identity derived from the "rt:address-family" base identity.

In the core routing data model, RIBs are represented as entries of the list "/routing/ribs/rib" in the operational state. The contents of RIBs are controlled and manipulated by control-plane protocol operations that may result in route additions, removals, and modifications. This also includes manipulations via the "static" and/or "direct" pseudo-protocols; see Section 5.3.1.

For every supported address family, exactly one RIB MUST be marked as the so-called default RIB to which control-plane protocols place their routes by default.

Simple router implementations that do not advertise the feature "multiple-ribs" will typically create one system-controlled RIB per supported address family and mark it as the default RIB.

More-complex router implementations advertising the "multiple-ribs" feature support multiple RIBs per address family that can be used for policy routing and other purposes.

The following action (see Section 7.15 of [RFC7950]) is defined for the "rib" list:

- o active-route -- return the active RIB route for the destination address that is specified as the action's input parameter.

5.3. Control-Plane Protocol

The core routing data model provides an open-ended framework for defining multiple control-plane protocol instances, e.g., for Layer 3 routing protocols. Each control-plane protocol instance MUST be assigned a type, which is an identity derived from the

"rt:control-plane-protocol" base identity. The core routing data model defines two identities for the direct and static pseudo-protocols (Section 5.3.1).

Multiple control-plane protocol instances of the same type MAY be configured.

5.3.1. Routing Pseudo-Protocols

The core routing data model defines two special routing protocol types -- "direct" and "static". Both are in fact pseudo-protocols, which means that they are confined to the local device and do not exchange any routing information with adjacent routers.

Every implementation of the core routing data model MUST provide exactly one instance of the "direct" pseudo-protocol type. It is the source of direct routes for all configured address families. Direct routes are normally supplied by the operating system kernel, based on the configuration of network interface addresses; see Section 6.2.

A pseudo-protocol of the type "static" allows for specifying routes manually. It MAY be configured in zero or multiple instances, although a typical configuration will have exactly one instance.

5.3.2. Defining New Control-Plane Protocols

It is expected that future YANG modules will create data models for additional control-plane protocol types. Such a new module has to define the protocol-specific data nodes, and it has to integrate into the core routing framework in the following way:

- o A new identity MUST be defined for the control-plane protocol, and its base identity MUST be set to "rt:control-plane-protocol" or to an identity derived from "rt:control-plane-protocol".
- o Additional route attributes MAY be defined, preferably in one place by means of defining a YANG grouping. The new attributes have to be inserted by augmenting the definitions of the node

/rt:routing/rt:ribs/rt:rib/rt:routes/rt:route

and possibly other places in the schema tree.

- o Data nodes for the new protocol can be defined by augmenting the "control-plane-protocol" data node under "/routing".

By using a "when" statement, the augmented data nodes specific to the new protocol SHOULD be made conditional and valid only if the value

of "rt:type" or "rt:source-protocol" is equal to (or derived from) the new protocol's identity.

It is also RECOMMENDED that protocol-specific data nodes be encapsulated in an appropriately named container with presence. Such a container may contain mandatory data nodes that are otherwise forbidden at the top level of an augment.

The above steps are implemented by the example YANG module for the Routing Information Protocol (RIP) in Appendix C.

5.4. Parameters of IPv6 Router Advertisements

YANG module "ietf-ipv6-router-advertisements" (Section 9.1), which is a submodule of the "ietf-ipv6-unicast-routing" module, augments the schema tree of IPv6 interfaces with definitions of the following variables as required by Section 6.2.1 of [RFC4861]:

- o send-advertisements
- o max-rtr-adv-interval
- o min-rtr-adv-interval
- o managed-flag
- o other-config-flag
- o link-mtu
- o reachable-time
- o retrans-timer
- o cur-hop-limit
- o default-lifetime
- o prefix-list: a list of prefixes to be advertised.

The following parameters are associated with each prefix in the list:

- * valid-lifetime
- * on-link-flag
- * preferred-lifetime

* autonomous-flag

NOTES:

1. The "IsRouter" flag, which is also required by [RFC4861], is implemented in the "ietf-ip" module [I-D.ietf-netmod-rfc7277bis] (leaf "ip:forwarding").
2. The original specification [RFC4861] allows the implementations to decide whether the "valid-lifetime" and "preferred-lifetime" parameters remain the same in consecutive advertisements or decrement in real time. However, the latter behavior seems problematic because the values might be reset again to the (higher) configured values after a configuration is reloaded. Moreover, no implementation is known to use the decrementing behavior. The "ietf-ipv6-router-advertisements" submodule therefore stipulates the former behavior with constant values.

6. Interactions with Other YANG Modules

The semantics of the core routing data model also depends on several configuration parameters that are defined in other YANG modules.

6.1. Module "ietf-interfaces"

The following boolean switch is defined in the "ietf-interfaces" YANG module [I-D.ietf-netmod-rfc7223bis]:

```
/if:interfaces/if:interface/if:enabled
```

If this switch is set to "false" for a network-layer interface, then all routing and forwarding functions MUST be disabled on this interface.

6.2. Module "ietf-ip"

The following boolean switches are defined in the "ietf-ip" YANG module [I-D.ietf-netmod-rfc7277bis]:

```
/if:interfaces/if:interface/ip:ipv4/ip:enabled
```

If this switch is set to "false" for a network-layer interface, then all IPv4 routing and forwarding functions MUST be disabled on this interface.

```
/if:interfaces/if:interface/ip:ipv4/ip:forwarding
```

If this switch is set to "false" for a network-layer interface, then the forwarding of IPv4 datagrams through this interface MUST be disabled. However, the interface MAY participate in other IPv4 routing functions, such as routing protocols.

/if:interfaces/if:interface/ip:ipv6/ip:enabled

If this switch is set to "false" for a network-layer interface, then all IPv6 routing and forwarding functions MUST be disabled on this interface.

/if:interfaces/if:interface/ip:ipv6/ip:forwarding

If this switch is set to "false" for a network-layer interface, then the forwarding of IPv6 datagrams through this interface MUST be disabled. However, the interface MAY participate in other IPv6 routing functions, such as routing protocols.

In addition, the "ietf-ip" module allows for configuring IPv4 and IPv6 addresses and network prefixes or masks on network-layer interfaces. Configuration of these parameters on an enabled interface MUST result in an immediate creation of the corresponding direct route. The destination prefix of this route is set according to the configured IP address and network prefix/mask, and the interface is set as the outgoing interface for that route.

7. Routing Management YANG Module

```
<CODE BEGINS> file "ietf-routing@2018-01-25.yang"
module ietf-routing {
  yang-version "1.1";
  namespace "urn:ietf:params:xml:ns:yang:ietf-routing";
  prefix "rt";

  import ietf-yang-types {
    prefix "yang";
  }

  import ietf-interfaces {
    prefix "if";
    description
      "A Network Management Datastore Architecture (NMDA)
       compatible version of the ietf-interfaces module
       is required.";
  }

  organization

10. IANA Considerations

[RFC8022] registered the following namespace URIs in the "IETF XML Registry" [RFC3688]:

```
URI: urn:ietf:params:xml:ns:yang:ietf-routing
Registrant Contact: The IESG.
XML: N/A; the requested URI is an XML namespace.
```

```
URI: urn:ietf:params:xml:ns:yang:ietf-ipv4-unicast-routing
Registrant Contact: The IESG.
XML: N/A; the requested URI is an XML namespace.
```

```
URI: urn:ietf:params:xml:ns:yang:ietf-ipv6-unicast-routing
Registrant Contact: The IESG.
XML: N/A; the requested URI is an XML namespace.
```

[RFC8022] registered the following YANG modules in the "YANG Module Names" registry [RFC6020]:

Name: ietf-routing
Namespace: urn:ietf:params:xml:ns:yang:ietf-routing
Prefix: rt
Reference: RFC 8022

Name: ietf-ipv4-unicast-routing
Namespace: urn:ietf:params:xml:ns:yang:ietf-ipv4-unicast-routing
Prefix: v4ur
Reference: RFC 8022

Name: ietf-ipv6-unicast-routing
Namespace: urn:ietf:params:xml:ns:yang:ietf-ipv6-unicast-routing
Prefix: v6ur
Reference: RFC 8022

This document registers the following YANG submodule in the "YANG Module Names" registry [RFC6020]:

Name: ietf-ipv6-router-advertisements
Module: ietf-ipv6-unicast-routing
Reference: RFC 8022

11. Security Considerations

The YANG modules specified in this document define a schema for data that is designed to be accessed via network management protocols such as NETCONF [RFC6241] or RESTCONF [RFC8040]. The lowest NETCONF layer is the secure transport layer, and the mandatory-to-implement secure transport is Secure Shell (SSH) [RFC6242]. The lowest RESTCONF layer is HTTPS, and the mandatory-to-implement secure transport is TLS [RFC5246].

The NETCONF access control model [RFC6536] provides the means to restrict access for particular NETCONF or RESTCONF users to a preconfigured subset of all available NETCONF or RESTCONF protocol operations and content.

There are a number of data nodes defined in this YANG module that are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., edit-config) to these data nodes without proper protection can have a negative effect on network operations. These are the subtrees and data nodes and their sensitivity/vulnerability:

/routing/control-plane-protocols/control-plane-protocol: This list specifies the control-plane protocols configured on a device.

/routing/ribs/rib: This list specifies the RIBs configured for the device.

Some of the readable data nodes in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control read access (e.g., via get, get-config, or notification) to these data nodes. These are the subtrees and data nodes and their sensitivity/vulnerability:

/routing/control-plane-protocols/control-plane-protocol: This list specifies the control-plane protocols configured on a device. Refer to the control plane models for a list of sensitive information.

/routing/ribs/rib: This list specifies the RIB and their contents for the device. Access to this information may disclose the network topology and or other information.

Appendix B. Minimum Implementation

Some parts and options of the core routing model, such as user-defined RIBs, are intended only for advanced routers. This appendix gives basic non-normative guidelines for implementing a bare minimum of available functions. Such an implementation may be used for hosts or very simple routers.

A minimum implementation does not support the feature "multiple-ribs". This means that a single system-controlled RIB is available for each supported address family -- IPv4, IPv6, or both. These RIBs are also the default RIBs. No user-controlled RIBs are allowed.

In addition to the mandatory instance of the "direct" pseudo-protocol, a minimum implementation should support configuring instance(s) of the "static" pseudo-protocol.

For hosts that are never intended to act as routers, the ability to turn on sending IPv6 router advertisements (Section 5.4) should be removed.

Platforms with severely constrained resources may use deviations for restricting the data model, e.g., limiting the number of "static" control-plane protocol instances.

Appendix C. Example: Adding a New Control-Plane Protocol

This appendix demonstrates how the core routing data model can be extended to support a new control-plane protocol. The YANG module "example-rip" shown below is intended as an illustration rather than a real definition of a data model for the Routing Information Protocol (RIP). For the sake of brevity, this module does not obey

all the guidelines specified in [I-D.ietf-netmod-rfc6087bis]. See also Section 5.3.2.

```
module example-rip {  
    yang-version "1.1";  
  
    namespace "http://example.com/rip";  
  
    prefix "rip";  
  
    import ietf-interfaces {  
        prefix "if";  
    }  
  
    import ietf-routing {  
        prefix "rt";  
    }  
  
    identity rip {  
        base rt:routing-protocol;  
        description  
            "Identity for the Routing Information Protocol (RIP).";  
    }  
  
    typedef rip-metric {  
        type uint8 {  
            range "0..16";  
        }  
    }  
  
    grouping route-content {  
        description  
            "This grouping defines RIP-specific route attributes.";

    description  
      "Time interval between periodic updates.";  
  }  
}  
}
```

Appendix D. Data Tree Example

This section contains an example of an instance data tree from the operational state, in the JSON encoding [RFC7951]. The data conforms to a data model that is defined by the following YANG library specification [RFC7895]:

```
{  
  "ietf-yang-library:modules-state": {  
    "module-set-id": "c2elf54169aa7f36e1a6e8d0865d441d3600f9c4",  
    "module": [  
      {  
        "name": "ietf-routing",  
        "revision": "2018-01-25",  
        "feature": [  
          "multiple-ribs",  
          "router-id"  
        ],  
        "namespace": "urn:ietf:params:xml:ns:yang:ietf-routing",  
        "conformance-type": "implement"  
      },  
      {  
        "name": "ietf-ipv4-unicast-routing",  
        "revision": "2018-01-25",  
        "namespace":  
          "urn:ietf:params:xml:ns:yang:ietf-ipv4-unicast-routing",  
        "conformance-type": "implement"  
      },  
      {  
        "name": "ietf-ipv6-unicast-routing",  
        "revision": "2018-01-25",  
        "namespace":  
          "urn:ietf:params:xml:ns:yang:ietf-ipv6-unicast-routing",
```

```

    "conformance-type": "implement",
    "submodule": [
      {
        "name": "ietf-ipv6-router-advertisements",
        "revision": "2018-01-25"
      }
    ],
  },
  {
    "name": "ietf-interfaces",
    "revision": "2017-12-16",
    "namespace": "urn:ietf:params:xml:ns:yang:ietf-interfaces",
    "conformance-type": "implement"
  },
  {
    "name": "ietf-inet-types",
    "namespace": "urn:ietf:params:xml:ns:yang:ietf-inet-types",
    "revision": "2013-07-15",
    "conformance-type": "import"
  },
  {
    "name": "ietf-yang-types",
    "namespace": "urn:ietf:params:xml:ns:yang:ietf-yang-types",
    "revision": "2013-07-15",
    "conformance-type": "import"
  },
  {
    "name": "iana-if-type",
    "namespace": "urn:ietf:params:xml:ns:yang:iana-if-type",
    "revision": "2014-05-08",
    "conformance-type": "implement"
  },
  {
    "name": "ietf-ip",
    "revision": "2017-12-16",
    "namespace": "urn:ietf:params:xml:ns:yang:ietf-ip",
    "conformance-type": "implement"
  }
]
}

```

A simple network setup as shown in Figure 2 is assumed: router "A" uses static default routes with the "ISP" router as the next hop. IPv6 router advertisements are configured only on the "eth1" interface and disabled on the upstream "eth0" interface.

Figure 2: Example of Network Configuration

The instance data tree could then be as follows:

```

{
  "ietf-interfaces:interfaces": {
