NETCONF WG Subscription Drafts

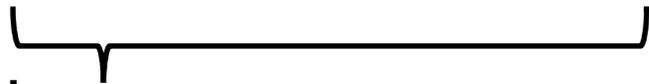

8. Custom Subscription to Event Streams
[draft-ietf-netconf-subscribed-notifications](#)

9. YANG Datastore Subscription
[draft-ietf-netconf-yang-push](#)

10. NETCONF Support for Event Notifications
[draft-ietf-netconf-netconf-event-notifications](#)

11. RESTCONF & HTTP Transport for Event Notifications
[draft-ietf-netconf-restconf-notif](#)

12. Notification Message Headers and Bundles
[draft-ietf-netconf-notification-messages](#)

Overview (covered in this presentation)
[draft-voit-netconf-subscription-and-notif-overview](#)

13. UDP based Publication Channel for Streaming Telemetry
[draft-ietf-netconf-udp-pub-channel](#)

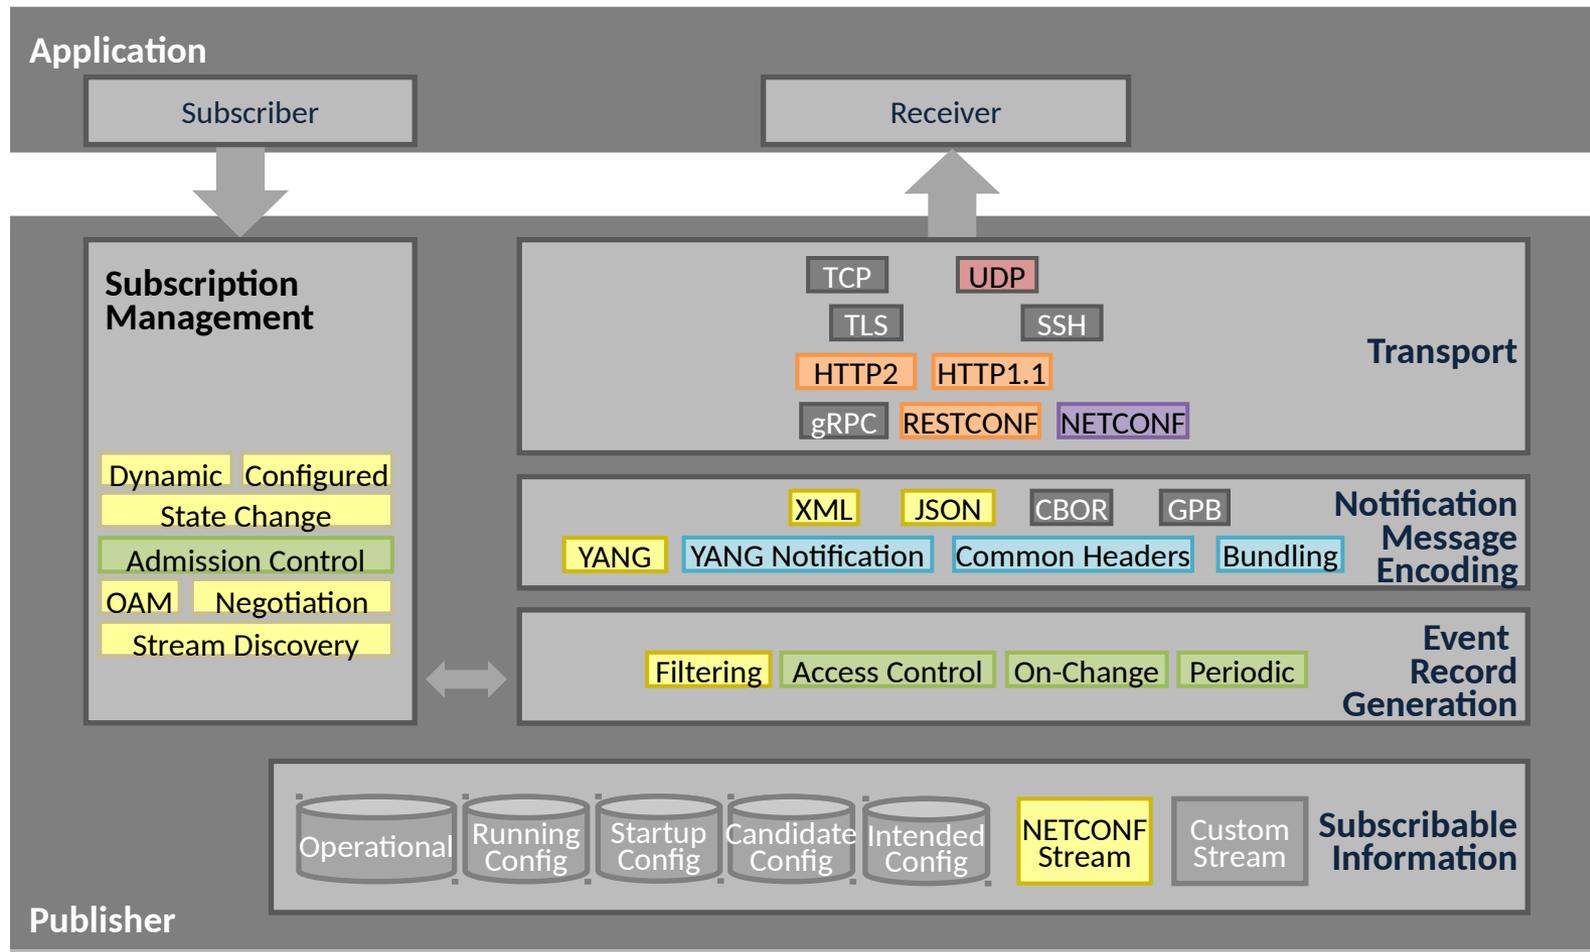

14. Subscription to Multiple Stream Originators
[draft-zhou-netconf-multi-stream-originators](#)

15. YANG PUSH Based Generalized Network Control Automation Problem Stmt.
[draft-bryskin-netconf-automation-framework](#)

16. Coap Transfer
[draft-birkholz-yang-push-coap-problemstatement](#)

17. Smart filters for Push Updates - Problem Statement
[draft-clemm-netconf-push-smart-filters-ps](#)

Adopted Drafts in Layered Framework

Legend

draft-ietf-netconf-yang-push	draft-ietf-netconf-udp-pub-channel
draft-ietf-netconf-subscribed-notifications	draft-ietf-netconf-netconf-event-notifications
draft-ietf-netconf-notification-messages	draft-ietf-netconf-restconf-notif

Updates since IETF #99

- v07, based on review comments
 - Model returns to string for stream
 - Model returns to explicit filter subtyping
 - RFC5277 exclusively used for one-way notifications (i.e., defer new encoding to draft-ietf-netconf-notification-messages)
 - SYSLOG identity removed
 - JSON & XML become optional features
 - Xpath and Subtree filtering become optional features
 - Added explicit state-machine for configured subscriptions
 - Cleaned up examples and terminology
- Issue SN#6 closed. Configured subscription key as integer

Issue SN #4

Can Transport vary across different receivers of a single configured subscription?

Current draft

Yes	No
<ul style="list-style-type: none">• Fewer subscriptions (scale benefit)• Can convert transport without requiring an application to learn a multiple subscription ids• No duplication of content during transport conversion.• Potential confusion in allowing transport to vary, but encoding not to vary?	<ul style="list-style-type: none">• Simpler model• But applications may need to create and track multiple subscription-ids for the same content.• Temporary duplication of content streams during transport change.

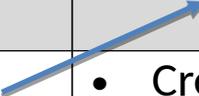

draft-ietf-netconf-subscribed-notifications

Issue SN #5

How to represent Source VRF of configured subscription?

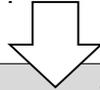

Current draft

String	Leafref to "ietf-network-instance" <code>/network-instances/network-instance/name</code>
<ul style="list-style-type: none">• Would populate with exact same name as would be in the leafref• Possible to name VRF which doesn't exist	<ul style="list-style-type: none">• Creates dependency on schema mount for subscriptions.• Source VRF is an optional capability, but publishers that don't care about VRFs must still import.• Establishes model dependency to draft-ietf-rtgwg-ni-model

SN#6 - String or Integer for Subscription ID

Rough Consensus Declared

Integer for all contexts	Use string for configuration, integer for updates
<ul style="list-style-type: none">• Need to partition integer space to avoid collisions/reuse.	<ul style="list-style-type: none">• Receiver must match context from subscription-started state change notification as id is different from what was configured.• Receiver app must be able to force transport reconnect if subscription state is lost.• Configured subscription correlation across multiple receivers is more complex (automatically assigned integer won't be the same across publishers.)• String must be human readable, and also act as a key.• Larger model

- Note: there were *many* other option variations considered beyond these two (including an elegant but more complex proposal from Rob Wilton.) For slide brevity, the two most different are shown.

Updates since IETF #99

- -v11, based on review comments
 - Integrated draft-ietf-netmod-revised-datastores (as this work as caught up)
 - Returned to explicit filter subtyping of v00-v05
 - Scrubbed the examples
 - Resynch on-change RPC
 - Deferred the multi-line card issue to draft-zhou-netconf-multi-stream-originators
- Open Issue: [YP#11: Shift to NMDA compliant structure](#)
 - Recommendation: authors will release NMDA compliant model versions (allowing side-by-side comparison) once all pre-WGLC issues are closed.

Updates since IETF #99 based on Comments

- -06 revision
 - Normative text placed up front (pages 2-4)
 - Removed all JSON text
 - Clarifications in call home text for retries
 - All examples move to Appendix
 - Scrubbed the examples (there were many fixes / changes)

NETCONF WG Subscription Drafts

8. Custom Subscription to Event Streams
[draft-ietf-netconf-subscribed-notifications](#)

9. YANG Datastore Subscription
[draft-ietf-netconf-yang-push](#)

10. NETCONF Support for Event Notifications
[draft-ietf-netconf-netconf-event-notifications](#)

11. RESTCONF & HTTP Transport for Event Notifications
[draft-ietf-netconf-restconf-notif](#)

12. Notification Message Headers and Bundles
[draft-ietf-netconf-notification-messages](#)

Overview (covered in this presentation)
[draft-voit-netconf-subscription-and-notif-overview](#)

13. UDP based Publication Channel for Streaming Telemetry
[draft-ietf-netconf-udp-pub-channel](#)

Recommendation: Start WGLC

14. Subscription to Multiple Stream Originators
[draft-zhou-netconf-multi-stream-originators](#)

15. YANG PUSH Based Generalized Network Control Automation Problem Stmt.
[draft-bryskin-netconf-automation-framework](#)

16. Coap Transfer
[draft-birkholz-yang-push-coap-problemstatement](#)

17. Smart filters for Push Updates - Problem Statement
[draft-clemm-netconf-push-smart-filters-ps](#)

Updates Needed (none posted since IETF #99)

- A new -04 revision must address the following:
 1. What does an 'ok' mean when sent after subscription-started for a configured subscription over HTTP2?

Which one-way notification encoding to use for a receiver? 5277, or draft-ietf-netconf-notification-messages?
 - Still need guidance on transparency of GRPC mapping to RESTCONF (e.g., RESTCONF uses GET, not POST.)
 - Interactions with the YANG Push for CoAP transfer problem stmt?
 - Doc scrubbing (move normative text up front, extract examples to Appendices JSON only examples)
- No implementations yet.
- Recommend deferring WGLC until there is concurrent support of draft-ietf-netconf-notification-messages to solve (1).

Updates since IETF #99

-v00 to -v02

- Alternative to 5277 one-way notification added
- Storage of default headers by notification type
- Backwards compatibility
- Discovering Receiver Support
 - Issue NM#1: Alternatives to use of client based capabilities discovery for NETCONF?
- Headers for module and notification-type
- yang-data encapsulation containers
- Upcoming: dialogs on specific headers
 - Signatures, attestation, others

Thank you!
