IRTF/NFVRG, IETF 100 Meeting, Singapore

14 November 2017

- Motivation and Research Topic
- Proposed Approach and Architecture
- Alignment With ETSI-NFV-MANO
- Conclusions & Future Work

Trivia:

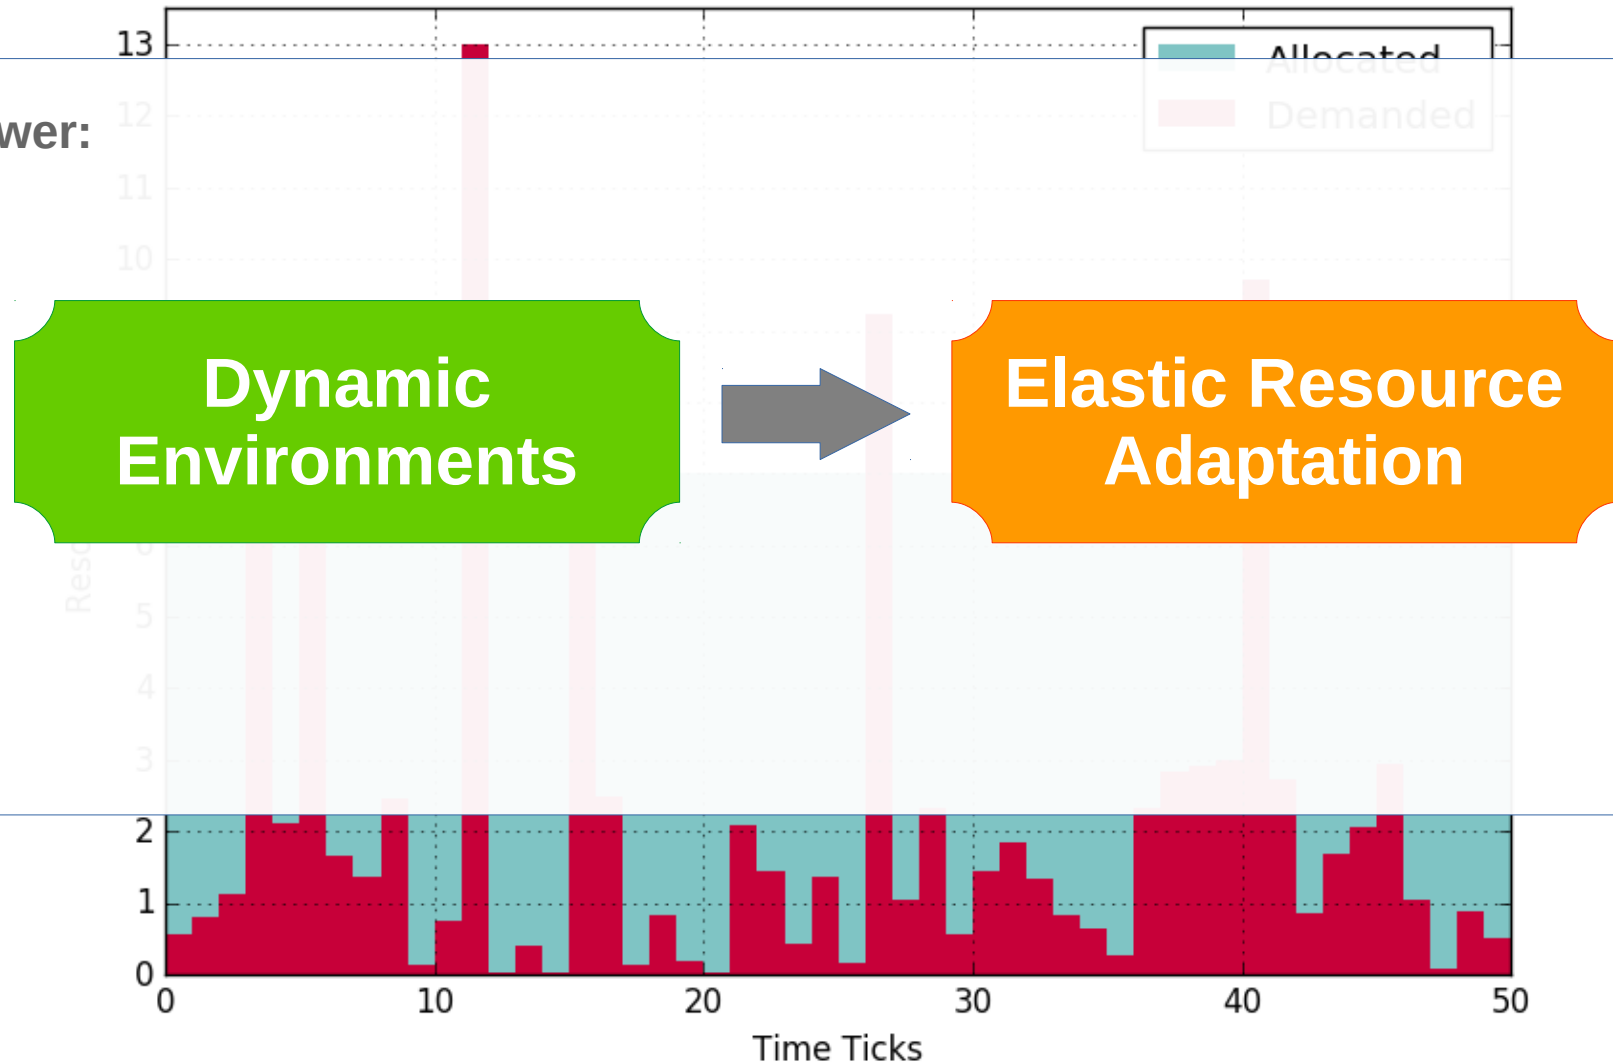

“High variation in resource demand” vs **“Fixed resource allocation”**.

Trivia:

“High variation in resource demand” vs **“Fixed resource allocation”**.

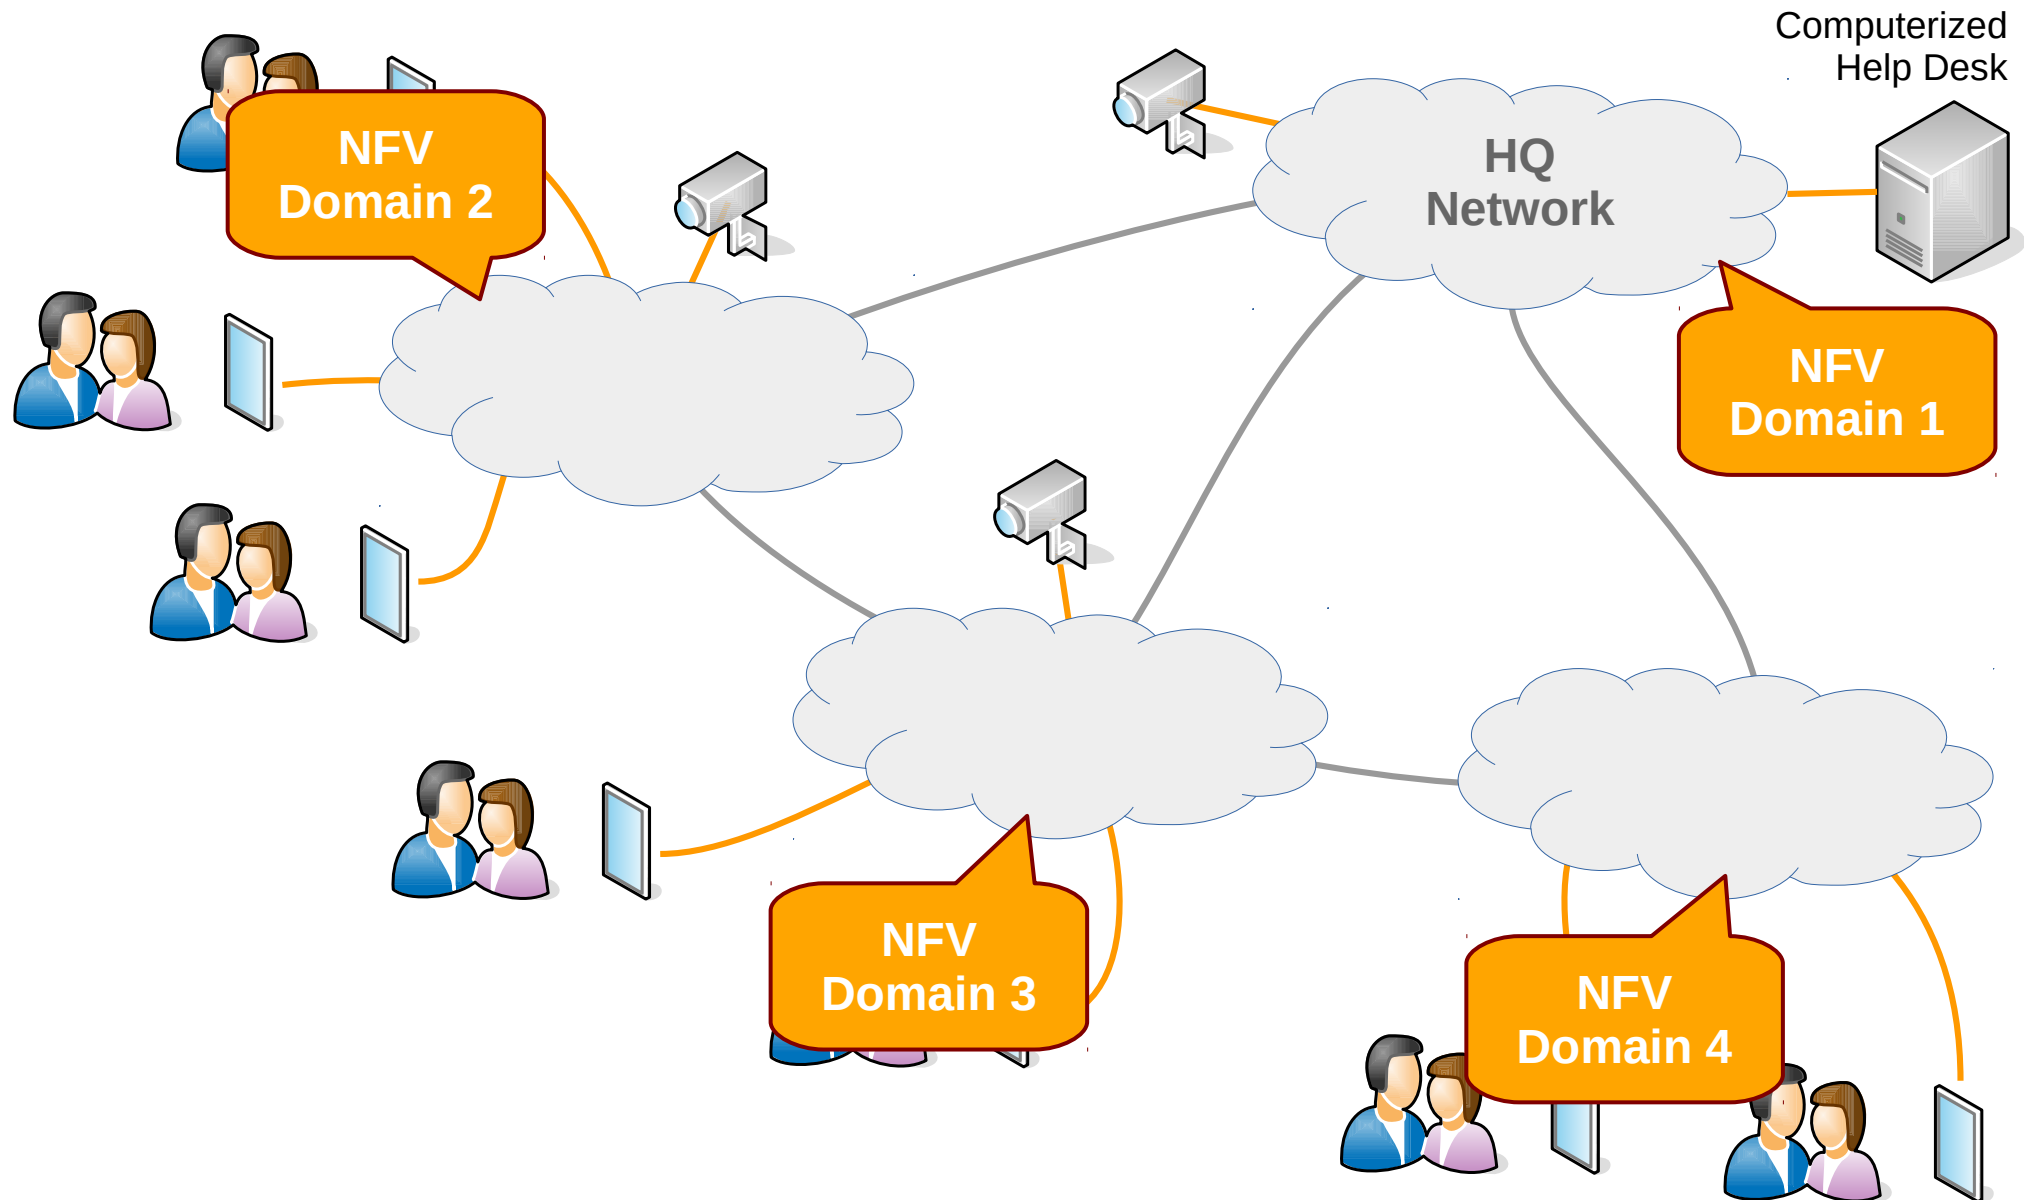

Answer:

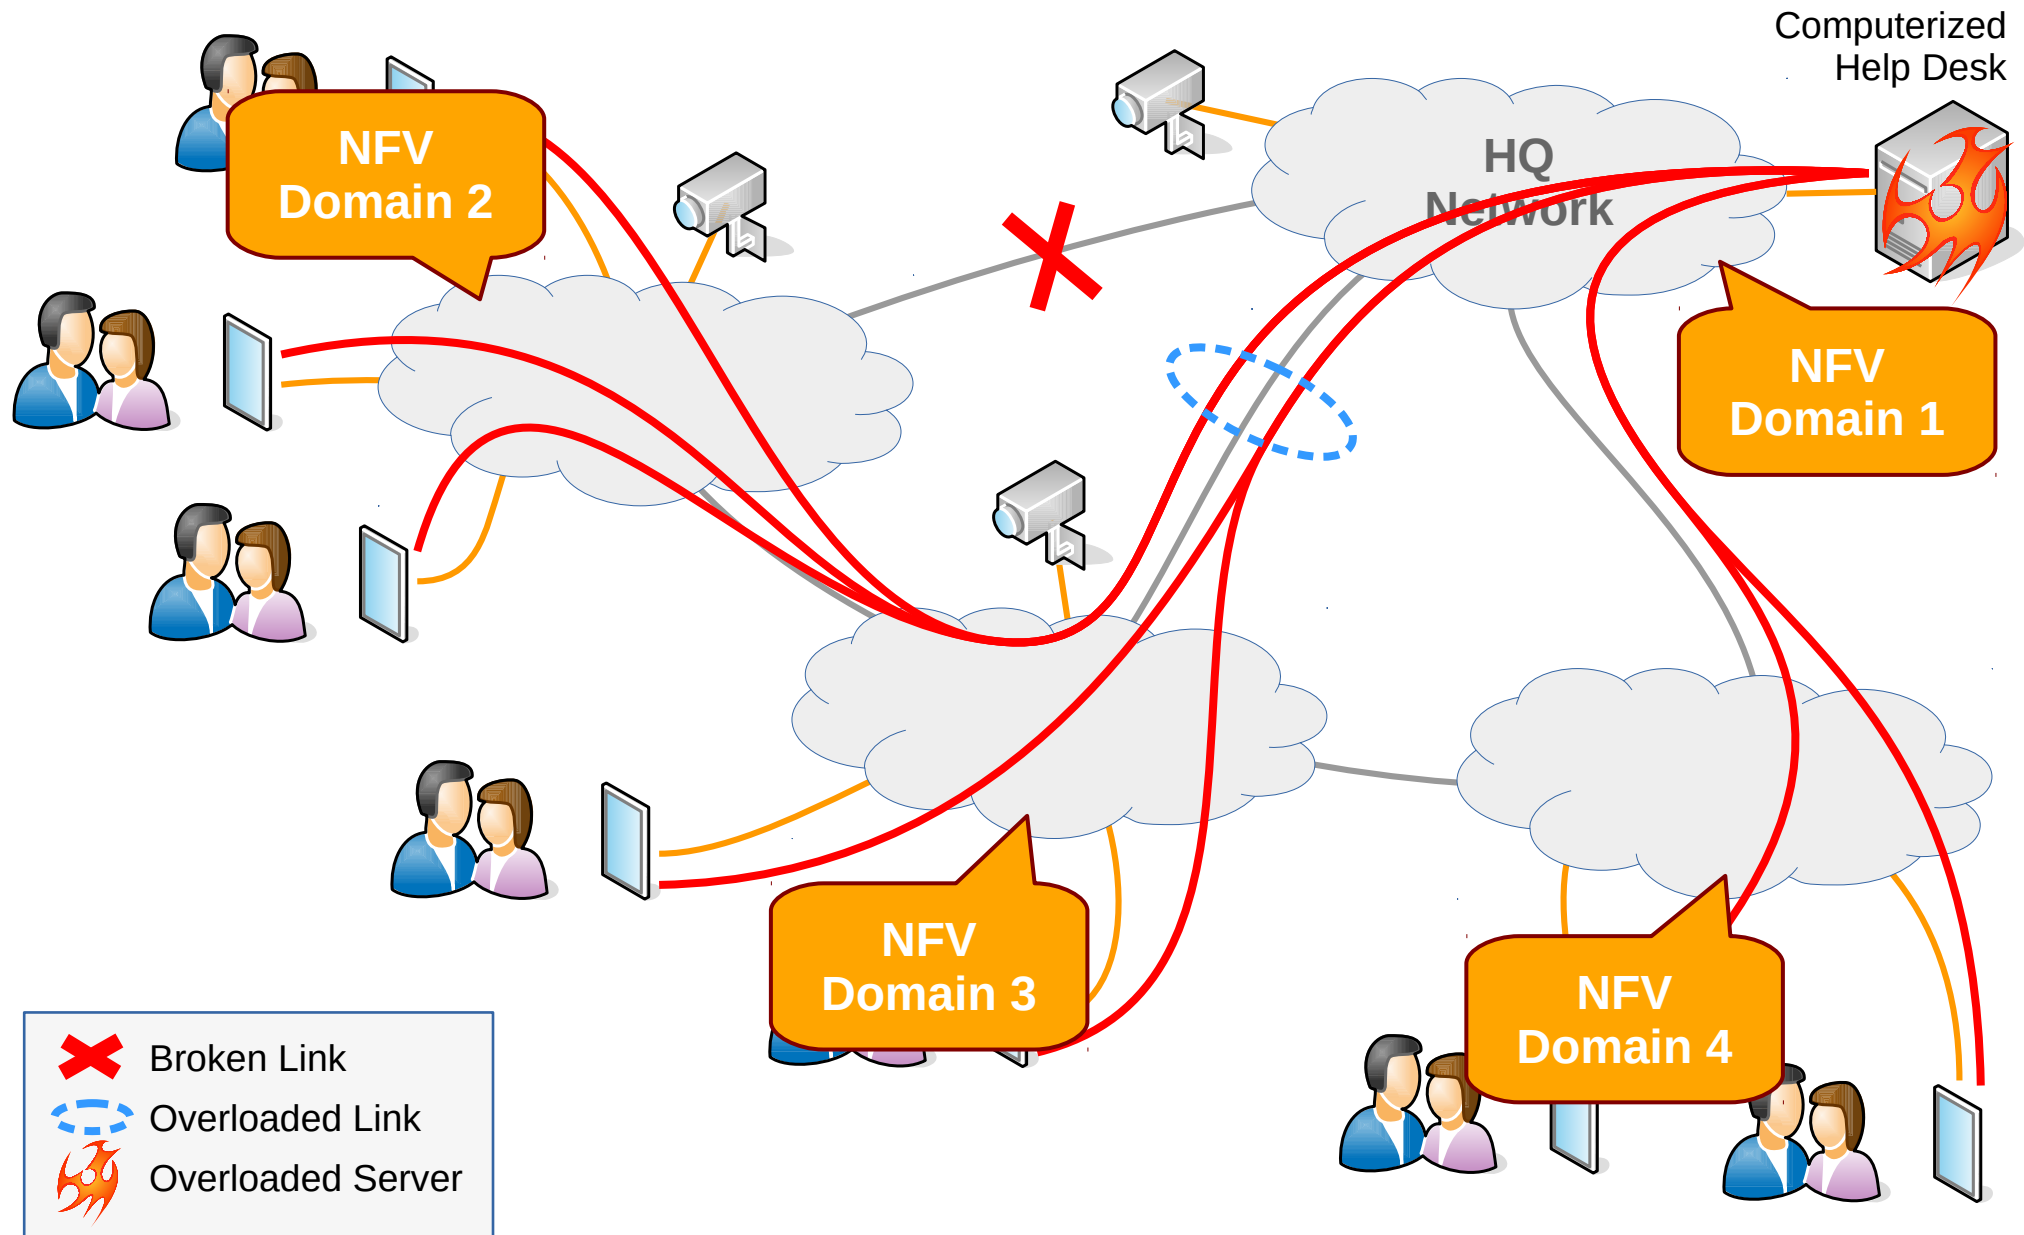

Use Case (I)

Use Case (II)

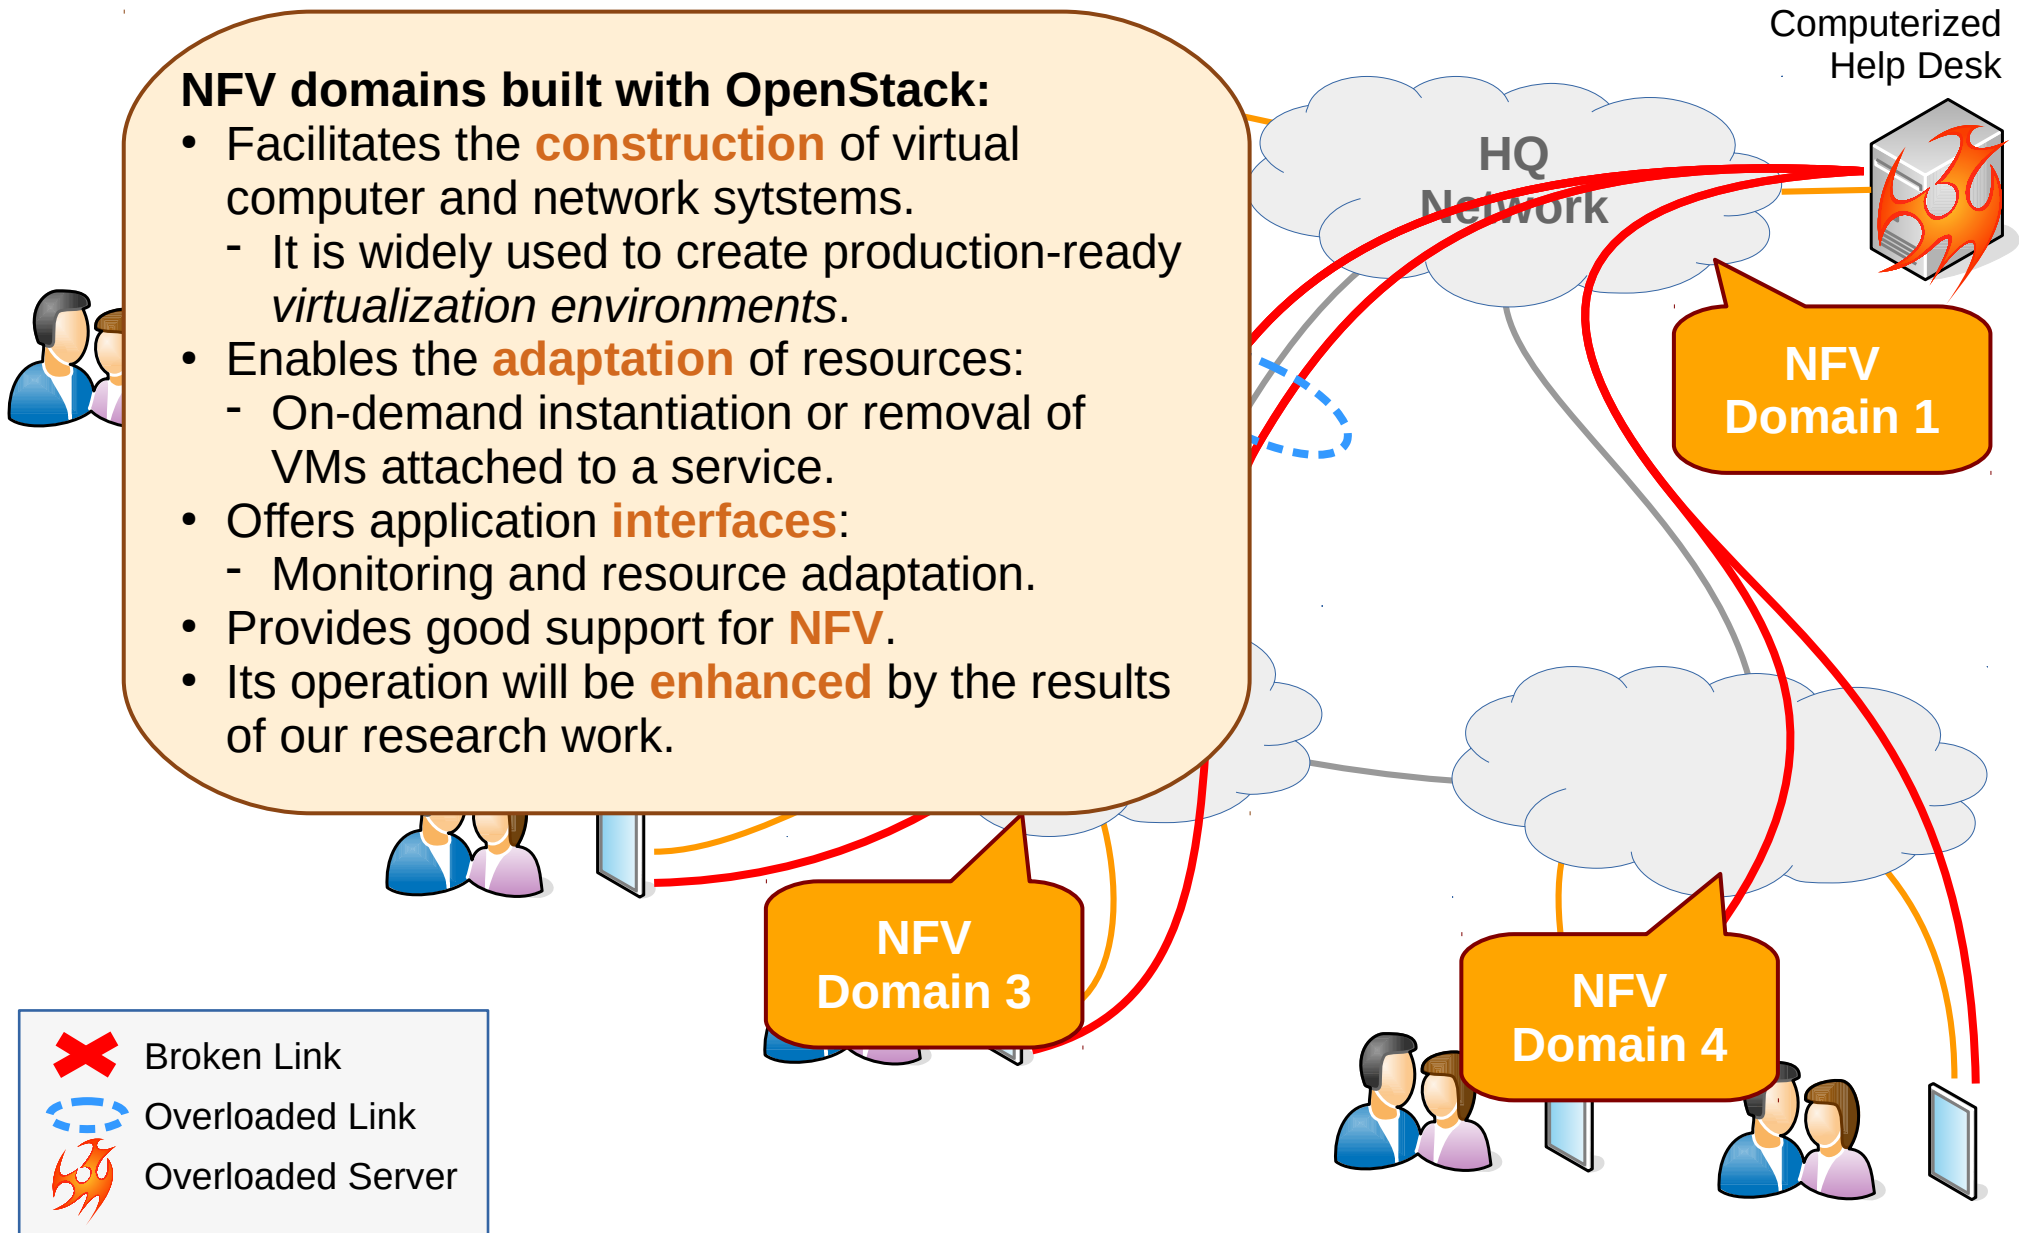

Use Case (III)

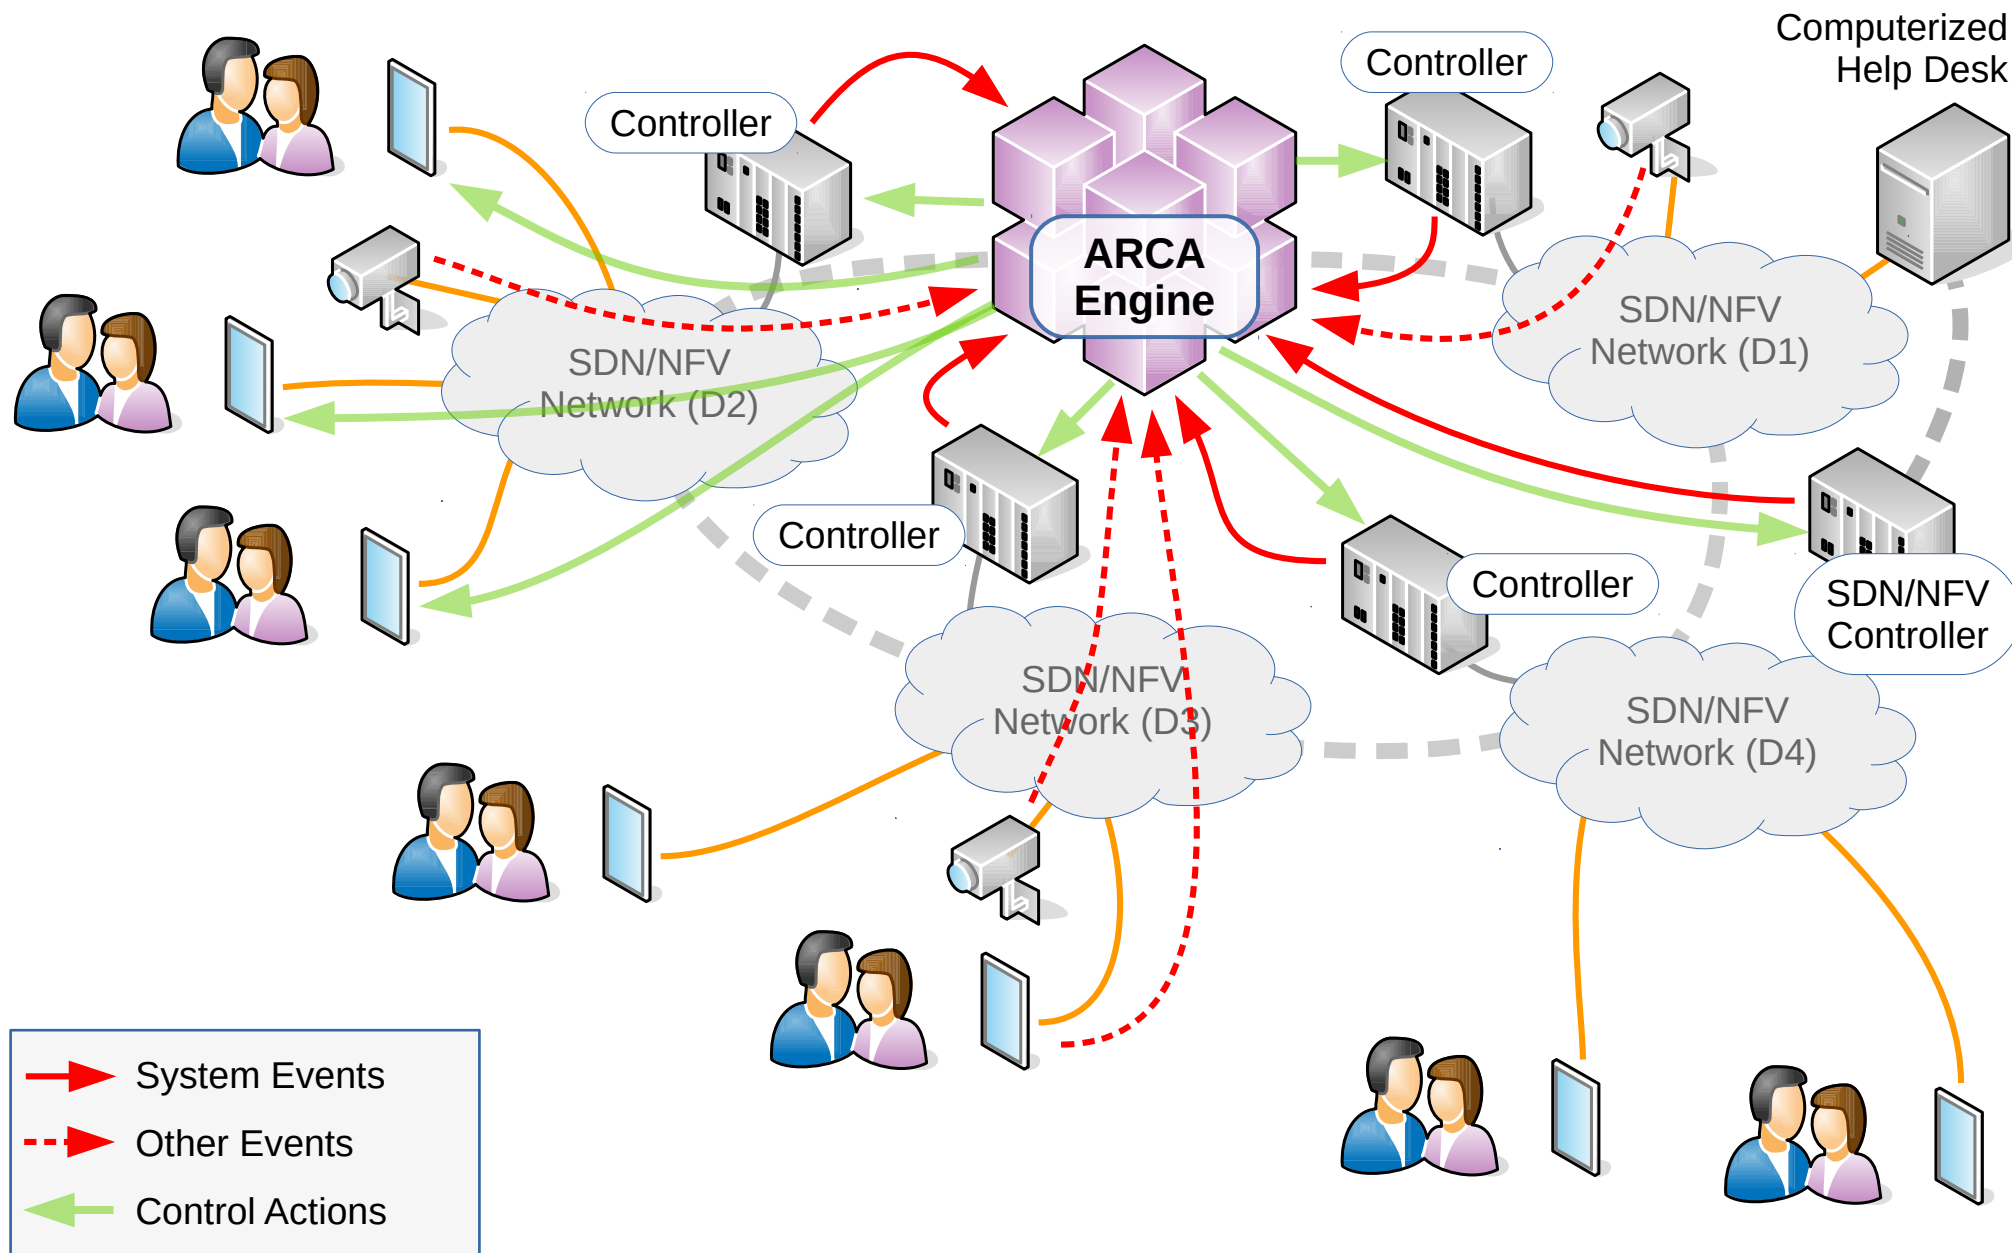

NFV domains built with OpenStack:

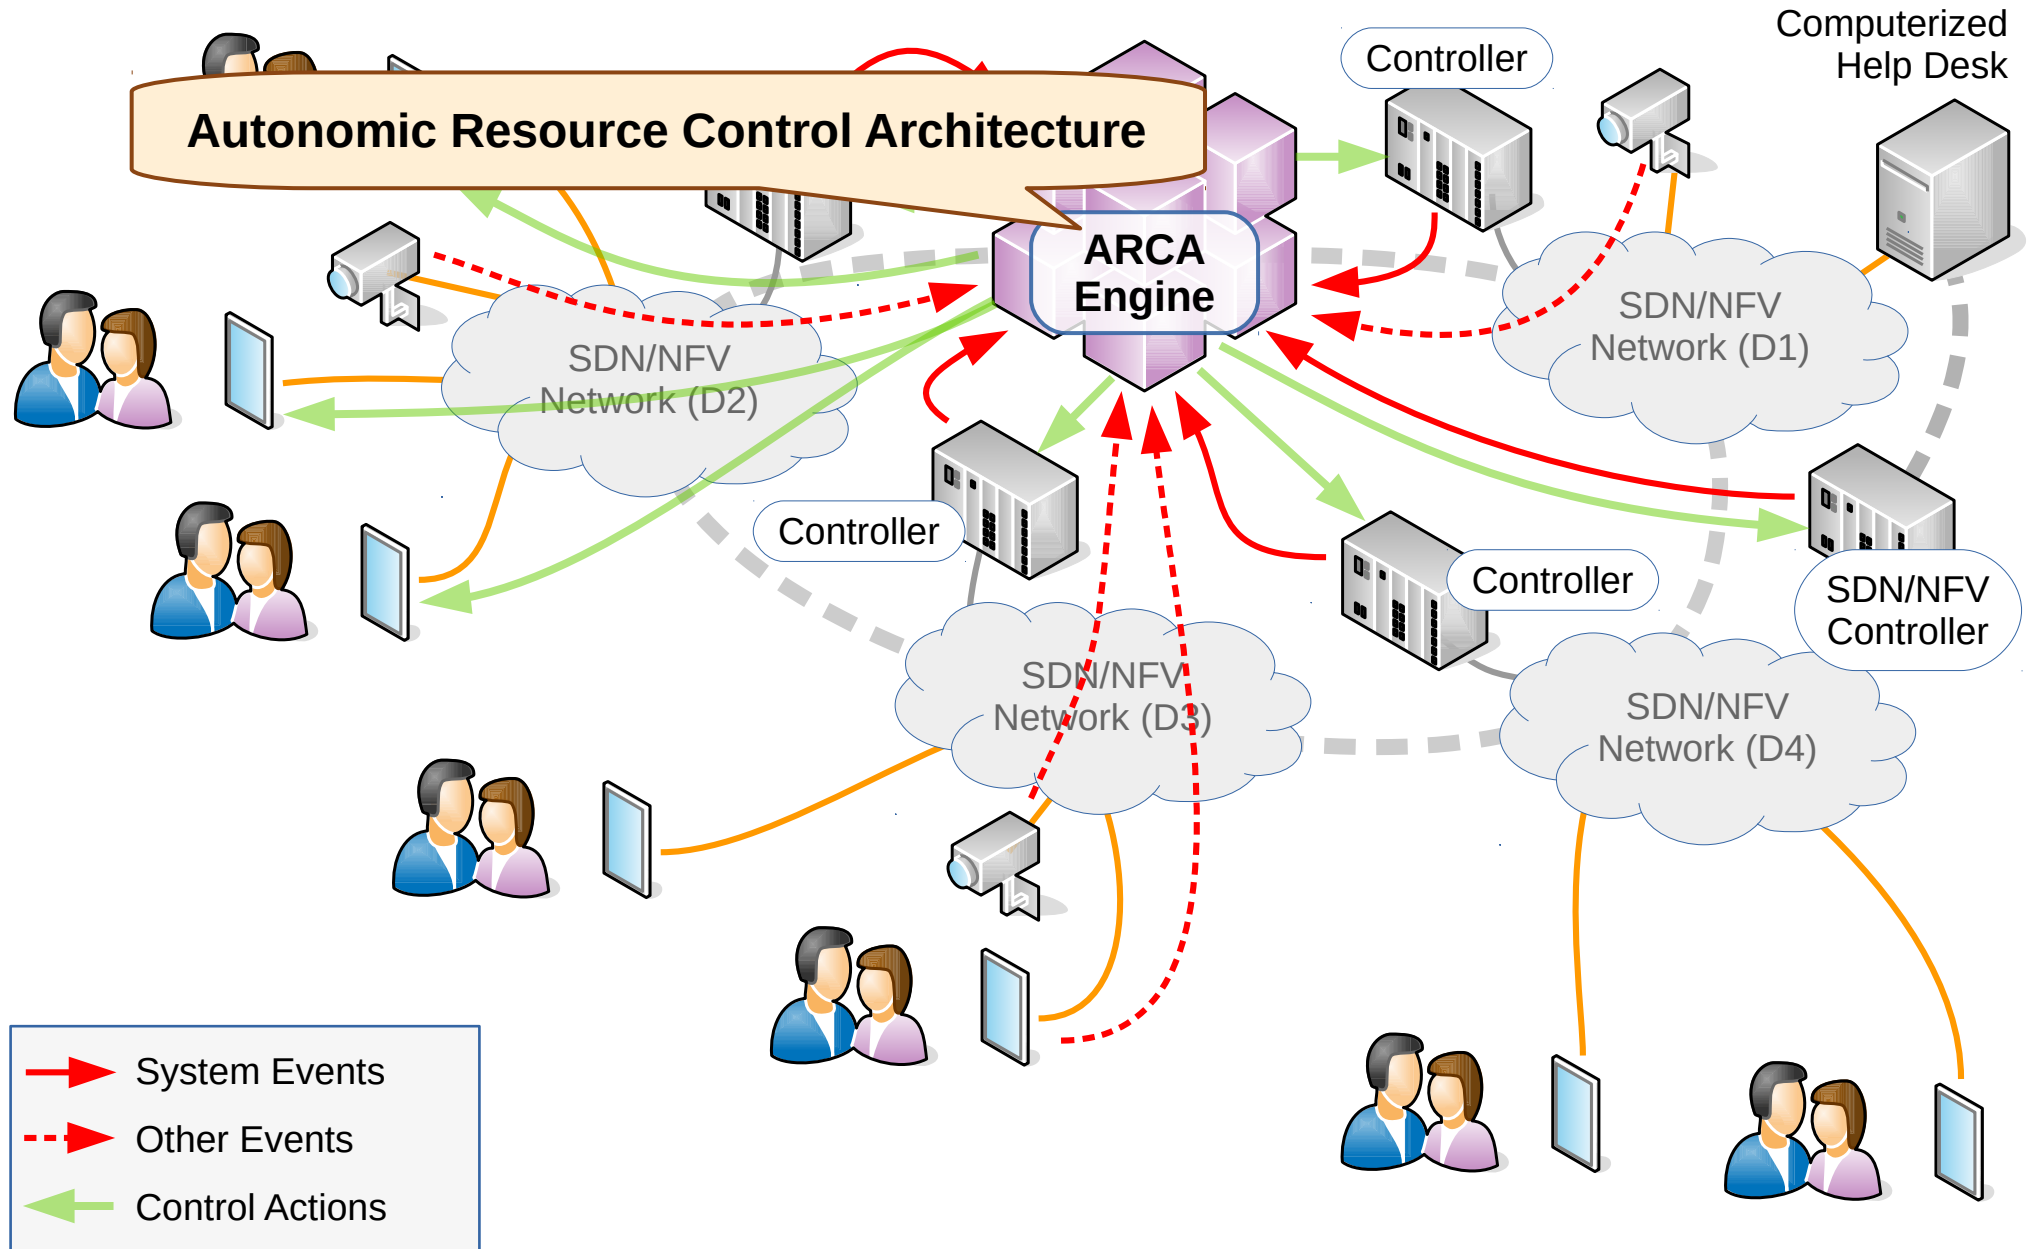

- Facilitates the **construction** of virtual computer and network systems.
 - It is widely used to create production-ready *virtualization environments*.
- Enables the **adaptation** of resources:
 - On-demand instantiation or removal of VMs attached to a service.
- Offers application **interfaces**:
 - Monitoring and resource adaptation.
- Provides good support for **NFV**.
- Its operation will be **enhanced** by the results of our research work.

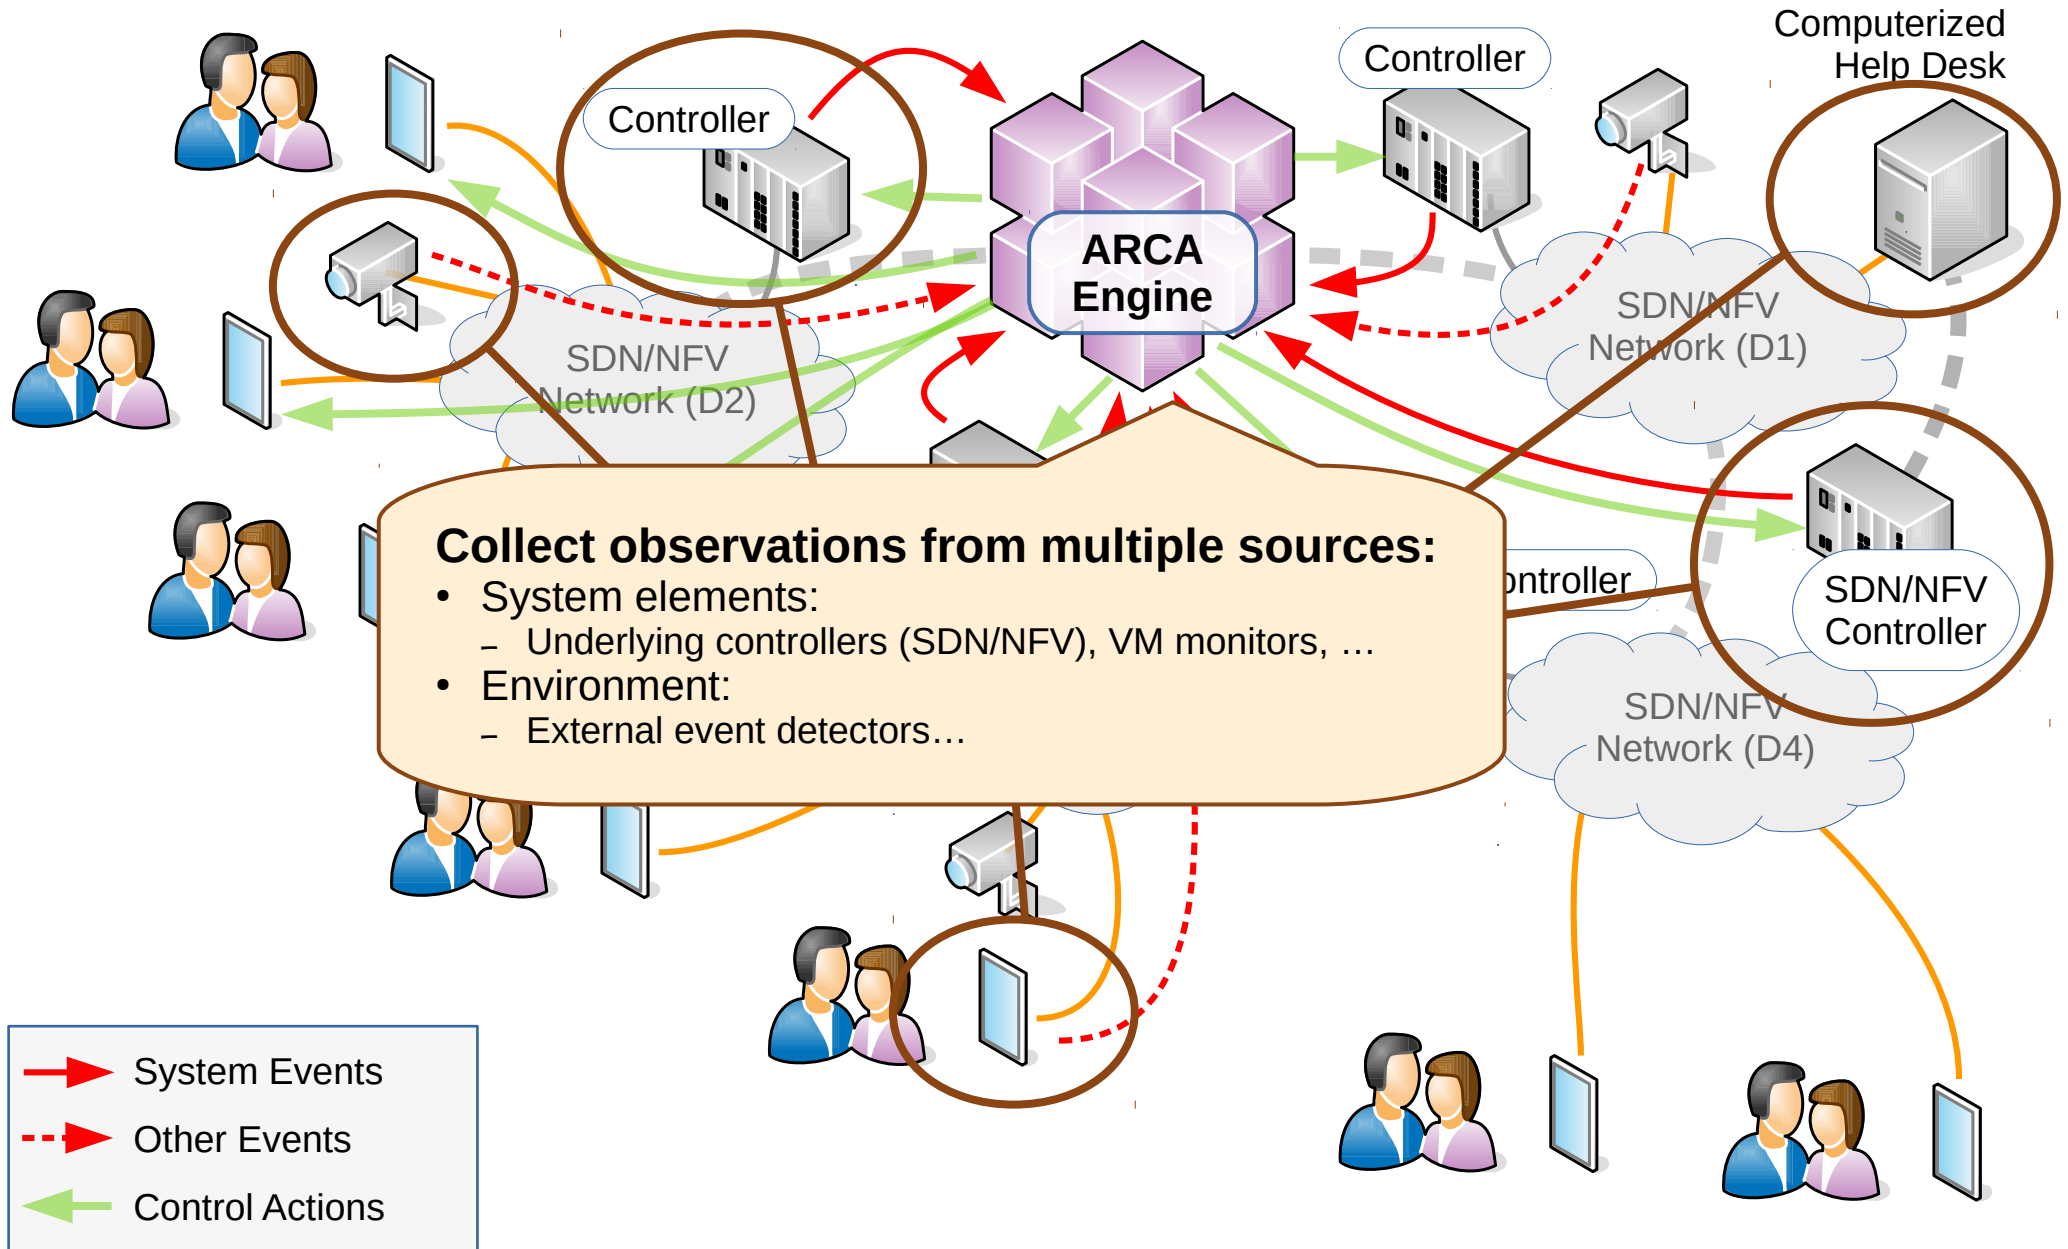

Proposed Approach (I)

Administrators set **operational boundaries** for the target system:

- Lower and upper amount of resources that can be assigned.
- Lower and upper load **thresholds**.

Alignment With ETSI-NFV-MANO (I)

- ARCA plays the role of the Virtualized Infrastructure Manager (**VIM**):
 - Provides autonomic capabilities to:
 - Discharge responsibilities from VNFM and NFVO.
 - Improve the scalability and resiliency of the system in case of disconnection from the orchestrator.
 - Is focused to accomplish requirements of Virtual Network Operators (VNOs).
- The **Nf-Vi** interface (IFA004, IFA019) in ARCA has been:
 - Bound to available underlying and overlying interfaces:
 - Ceilometer/Gnocchi provided by OpenStack.
 - Extended to enable interactions with external elements:
 - Physical / environmental event (incident) detectors.
 - Big Data: analyzers, data sources, etc.
- The **Or-Vi** interface (IFA005) is provided by the basic specification of control/management targets:
 - Its main communication artifact is the specification of control statements:
 - Represent the rules and policies that ARCA must enforce.
 - Will be provided by system administrators and/or external orchestrators.
 - ARCA will enforce such statements in response to changes in the environment and/or user requirements:
 - Requirements are communicated with additional statements.
- The **Vi-Vnfm** interface (IFA006) is currently out of the scope of ARCA.

- Designed **ARCA**:
 - To provide functions of the Virtual Infrastructure Manager (VIM) of NFV-MANO.
 - Extended VIM interfaces to meet real requirements of the real world:
 - Emergency scenarios (!)
 - Achieved good performance within an OpenStack-based deployment:
 - Detailed **overlying** and **underlying** infrastructures.
 - Reproduction of production-like environments to ensure **transferable research results**.
- SDN/NFV and OpenStack stakeholders will benefit from ARCA features:
 - **Efficient** use of **resources**:
 - Further reduce CAPEX and OPEX:
 - Benefit to both infrastructure providers and consumers.
- Next steps:
 - Keep **reducing** ARCA **response time**.
 - Increase complexity of the validation scenario:
 - Mix clients and servants in the same domains.
 - Align **ARCA**-based VNC to **additional requirements** from **NFV/SDN**.

**Thanks for Your
Attention**
