

Discovering Provisioning Domain Names and Data

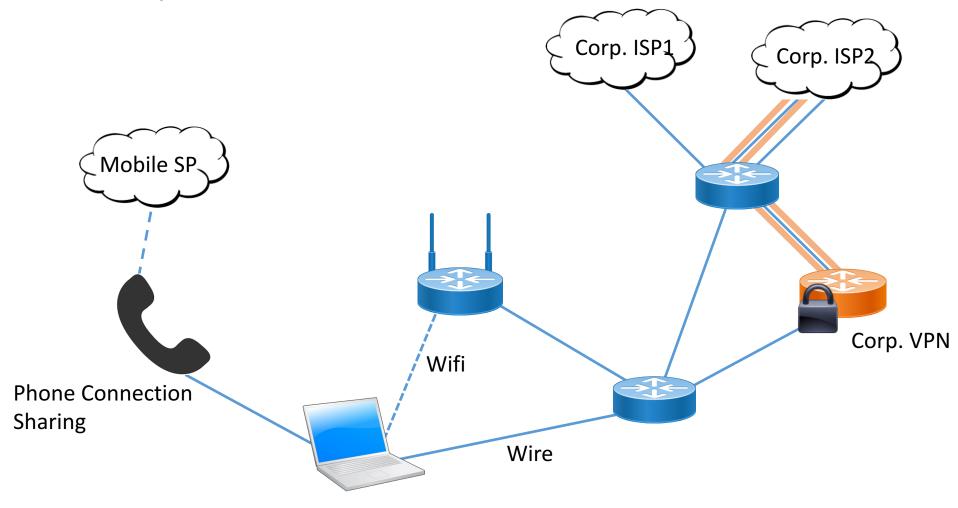

draft-ietf-intarea-provisioning-domains-00

P. Pfister, E. Vyncke, T. Pauly, D. Schinazi, M. Keane

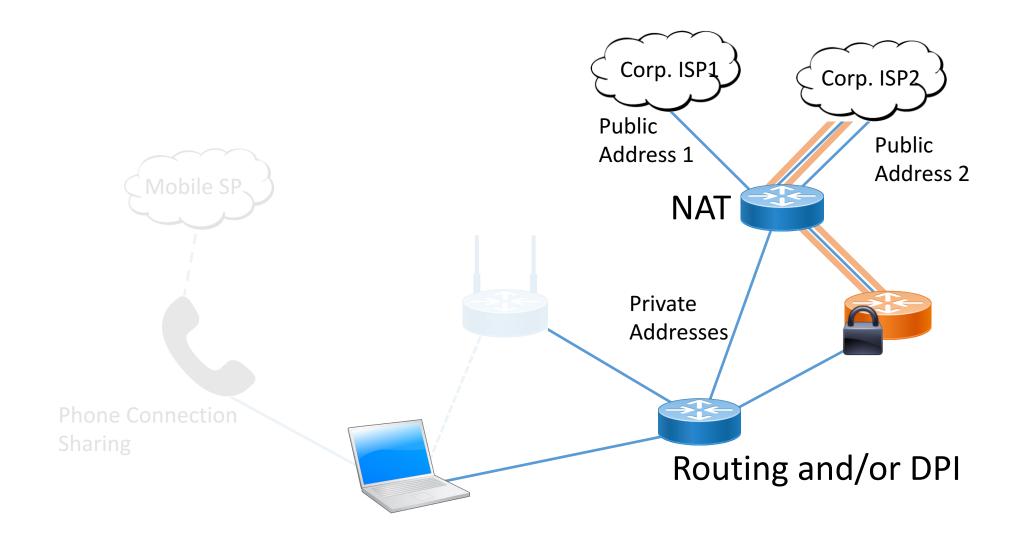

Hosts and networks are multi-homed

Just a few examples...

Multi-Homing, the legacy way...

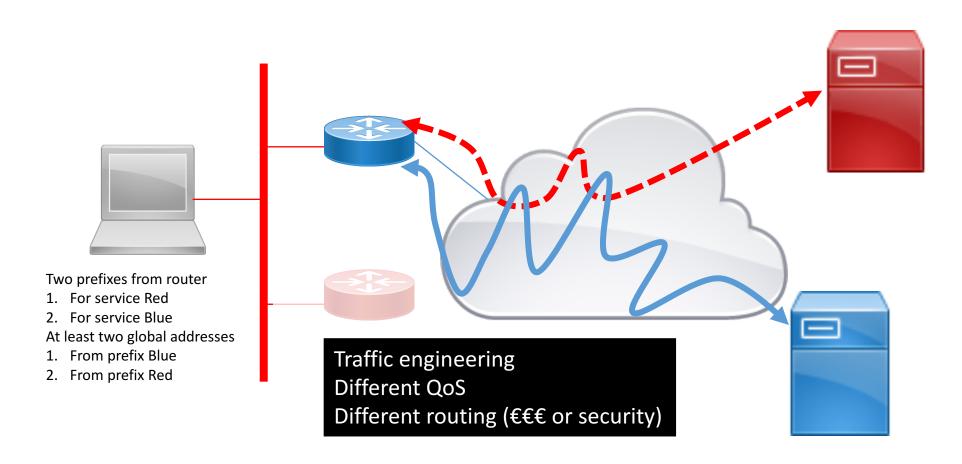

Bundling IP address & DNS resolver

Multihoming and CDNs

- Name lookups for resources stored on CDNs give different answers depending on the network connection
- Host on homenet may look up name using resolver from provider A, then connect to CDN using provider B
- This will generate support requests
- What to do?

Service Selection

The purpose of this draft is to:

1. Identify Provisioning Domains (PvDs).

[RFC7556] Provisioning Domains (PvDs) are consistent sets of network properties that can be implicit, or advertised explicitly.

Differentiate provisioning domains by using FQDN identifiers.

2. Give PvD Additional Information.

Name, characteristics, captive portal, etc...

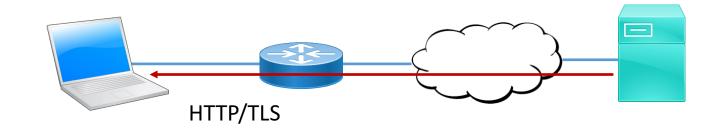

Step 1: Identify PvDs

With the PvD ID Router Advertisement Option

- At most one occurrence in each RA.
- PvD ID is an FQDN associated with options in the RA.
- H bit to indicate Additional Information is available with HTTPS.
- L bit to indicate the PvD has DHCPv4 on the link.
- Seq. number used for push-based refresh.

Step 2: Get the PvD Additional Data

When the H bit is set:

GET https://<pvd-id>/.well-known/pvd

Using network configuration (source address, default route, DNS, etc...) **associated with the received PvD**.

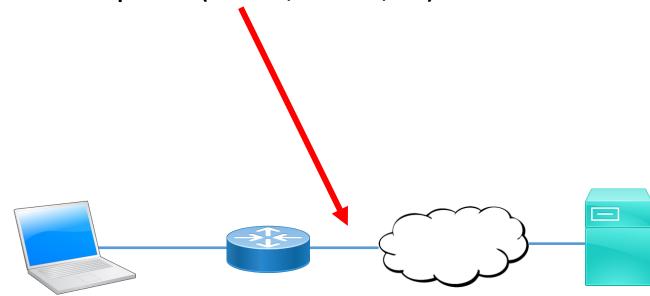

Step 2: Get the PvD Additional Data

```
"name": "Foo Wireless",
"expires": "2017-07-23T06:00:00Z",
"prefixes": ["2001:db8:1::/48", "2001:db8:4::/48"],
"localizedName": "Foo-Hôtel à Paris Wifi",
"dnsZones": ["example.com", "sub.example.com"];
"characteristics": {
      "maxThroughput": { "down":200000, "up": 50000 },
      "minLatency": { "down": 0.1, "up": 1 }
Some other examples (see also https://smart.mpvd.io/.well-known/pvd):
   noInternet : true,
   metered : true,
   captivePortalURL : "https://captive.org/foo.html"
```

Step 2: Additional Data Describing the Network

- Cost of the network access
- Performance of the first uplink (ADSL, FTTH, ...)
- Captive portal
- Walled garden
- •

Implementation status

Linux - https://github.com/IPv6-mPvD

- pvdd: A Daemon to manage PvD IDs and Additional Data
- Linux Kernel patch for RA processing
- iproute tool patch to display PvD IDs
- Wireshark dissector
- RADVD and ODHCPD sending PvD ID

Implemented in one commercial vendor router

A New, Evolutive API and Transport-Layer Architecture for the Internet: https://www.neat-project.org/

European H-2020 project 10 partners (Cisco, Mozilla, EMC, Celerway...)

Integration to NEAT code: https://github.com/NEAT-
