A YANG Data Model for Resource Reservation Protocol (RSVP)
draft-ietf-teas-yang-rsvp-08

Abstract

This document defines a YANG data model for the configuration and management of RSVP Protocol. The model covers the building blocks of the RSVP protocol that can be augmented and used by other RSVP extension models such as RVSP extensions to Traffic-Engineering (RSVP-TE). The model covers the configuration, operational state, remote procedural calls, and event notifications data.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on May 2, 2018.

1. Introduction

YANG [RFC6020] is a data definition language that was introduced to define the contents of a conceptual data store that allows networked devices to be managed using NETCONF [RFC6241]. YANG is proving relevant beyond its initial confines, as bindings to other interfaces (e.g. ReST) and encoding other than XML (e.g. JSON) are being defined. Furthermore, YANG data models can be used as the basis of

implementation for other interfaces, such as CLI and programmatic APIs.

This document defines a YANG data model that can be used to configure and manage the RSVP protocol [RFC2205]. This model covers RSVP protocol building blocks that can be augmented and used by other RSVP extension models- such as for signaling RSVP-TE MPLS (or other technology specific) Label Switched Paths (LSP)s.

1.1. Terminology

In this document, the key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" are to be interpreted as described in BCP 14, RFC 2119 [RFC2119].

1.2. Tree Diagram

A simplified graphical representation of the data model is presented in each section of the model. The following notations are used for the YANG model data tree representation.

<status> <flags> <name> <opts> <type>

<status> is one of:

- + for current
- x for deprecated
- o for obsolete

<flags> is one of:

- rw for read-write configuration data
- ro for read-only non-configuration data
- x for execution rpcs
- n for notifications

<name> is the name of the node

If the node is augmented into the tree from another module, its name is printed as <prefix>:<name>

<opts> is one of:

- ? for an optional leaf or node
- ! for a presence container
- * for a leaf-list or list
- Brackets [<keys>] for a list's keys
- Curly braces {<condition>} for optional feature that make node conditional
- Colon : for marking case nodes
- Ellipses ("...") subtree contents not shown

Parentheses enclose choice and case nodes, and case nodes are also marked with a colon (":").

<type> is the name of the type for leafs and leaf-lists.

1.3. Prefixes in Data Node Names

In this document, names of data nodes and other data model objects are prefixed using the standard prefix associated with the corresponding YANG imported modules, as shown in Table 1.

Prefix	YANG module	Reference
yang	ietf-yang-types	[RFC6991]
inet	ietf-inet-types	[RFC6991]
rt-type	ietf-routing-types	XX
key-chain	ietf-key-chain	XX

Table 1: Prefixes and corresponding YANG modules

2. Design Considerations

2.1. Module Hierarchy

The RSVP base YANG module augments the "control-plane-protocol" list in ietf-routing [RFC8022] module with specific RSVP parameters in an "rsvp" container. It also defines an extension identity "rsvp" of base "rt:routing-protocol" to identify the RSVP protocol.

During modeling discussion, some RSVP features are categorized as core to the functionality of the protocol, and hence, are supported by all vendors claiming the support for RSVP. These features' configuration and state were grouped in the RSVP base module.

Other extended RSVP features are categorized as either optional or providing additional knobs to provide better tune basic functionality of the RSVP protocol. The support for extended RSVP features by all vendors was considered optional. Such features were grouped in a separate RSVP extended module.

The augmentation of the RSVP model by other models (e.g. RSVP-TE for MPLS or other technologies) are considered outside the scope of this document and discussed in separate document(s).

Figure 1: Relationship of RSVP and RSVP extended modules with other protocol modules

The RSVP base model does not aim to be feature complete. The primary intent is to cover a set of standard core features (listed below) that are commonly in use.

- o Authentication ([RFC2747])
- o Refresh Reduction ([RFC2961])
- o Hellos ([RFC3209])
- o Graceful Restart ([RFC3473], [RFC5063])

The extended RSVP YANG model covers non-basic configuration(s) for RSVP feature(s) as well as optional RSVP feature that are not a must for basic RSVP operation.

2.2. State Data Organization

The Network Management Datastore Architecture (NMDA) [I-D.dsdt-nmda-guidelines] addresses the "OpState" that was discussed in the IETF. As per NMDA guidelines for new models and models that are not concerned with the operational state of configuration information, this revision of the draft adopts the NMDA proposal for configuration and state data of this model.

2.3. Configuration Inheritance

The defined data model supports configuration inheritance for neighbors, and interfaces. Data elements defined in the main container (e.g. the container that encompasses the list of

interfaces, or neighbors) are assumed to apply equally to all elements of the list, unless overridden explicitly for a certain element (e.g. interface). Vendors are expected to augment the above container(s) to provide the list of inheritance command for their implementations.

3. Model Organization

This document divides the RSVP model into two modules: the RSVP base and extended. Each module covers the configuration, state, notification and RPCs of data. The relationship between the different modules is depicted in Figure 1.

3.1. RSVP Base YANG Model

This section describes the RSVP base YANG data model. The container "rsvp" is the top level container in this data model. The presence of this container enables the RSVP protocol functionality.

Data for such state is contained under the respective "state" sub-container of the intended object (e.g. interface) as shown in Figure 2.

```
module: ietf-rsvp
  +--rw rsvp!
    +--rw globals
      +-- rw config
        <<intended configuration>>
      .
      +-- ro state
        <<applied configuration>>
        <<derived state associated with the tunnel>>
      .
    +--rw interfaces
      +-- rw config
        <<intended configuration>>
      .
      +-- ro state
        <<applied configuration>>
        <<derived state associated with the tunnel>>
      .
    +--rw neighbors
      +-- rw config
        <<intended configuration>>
      .
      +-- ro state
```

```

        <<applied configuration>>
        <<derived state associated with the tunnel>>
    .
    .
+--rw sessions
    +-- rw config
        <<intended configuration>>
    .
    +-- ro state
        <<applied configuration>>
        <<derived state associated with the tunnel>>
    .
rpcs:
    +--x global-rpc
    +--x interfaces-rpc
    +--x neighbors-rpc
    +--x sessions-rpc
notifications:
    +--n global-notif
    +--n interfaces-notif
    +--n neighbors-notif
    +--n sessions-notif

```

Figure 2: RSVP high-level tree model view

The following subsections provide overview of the parts of the model pertaining to configuration and state data.

Configuration and state data are organized into those applicable globally (node scope), per interfaces, per neighbors, or per session.

3.1.1. Global Data

This branch of the data model covers global configuration and states that control RSVP protocol behavior.

3.1.2. Interface Data

This branch of the data model covers configuration and state elements relevant to one or all RSVP interfaces. Any data configuration applied at the "interfaces" container level are equally applicable to all interfaces - unless overridden by explicit configuration under a specific interface.

3.1.3. Neighbor Data

This branch of the data model covers configuration of elements relevant to RSVP neighbors. This would be discussed in detail in future revisions.

3.1.4. Session Data

This branch of the data model covers configuration of elements relevant to RSVP sessions. This would be discussed in detail in future revisions.

3.2. RSVP Extended YANG Model

The RSVP extended YANG model covers optional or non-core RSVP feature(s). It also covers feature(s) that are not necessarily supported by all vendors, and hence, guarded with "if-feature" checks.

3.2.1. Tree Diagram

Figure 4 shows the YANG tree representation for configuration and state data that is augmenting the RSVP basic module:

```

Figure 5: RSVP extended YANG module

4. IANA Considerations

This document registers the following URIs in the IETF XML registry [RFC3688]. Following the format in [RFC3688], the following registration is requested to be made.

URI: urn:ietf:params:xml:ns:yang:ietf-rsvp XML: N/A, the requested URI is an XML namespace.

URI: urn:ietf:params:xml:ns:yang:ietf-rsvp-extended XML: N/A, the requested URI is an XML namespace.

This document registers a YANG module in the YANG Module Names registry [RFC6020].

name: ietf-rsvp namespace: urn:ietf:params:xml:ns:yang:ietf-rsvp
prefix: ietf-rsvp reference: RFC3209

name: ietf-rsvp-extended namespace: urn:ietf:params:xml:ns:yang:ietf-rsvp-extended
prefix: ietf-rsvp-extended reference: RFC3209

5. Security Considerations

The YANG module defined in this memo is designed to be accessed via the NETCONF protocol [RFC6241]. The lowest NETCONF layer is the secure transport layer and the mandatory-to-implement secure transport is SSH [RFC6242]. The NETCONF access control model [RFC6536] provides means to restrict access for particular NETCONF

users to a pre-configured subset of all available NETCONF protocol operations and content.

There are a number of data nodes defined in the YANG module which are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., <edit-config>) to these data nodes without proper protection can have a negative effect on network operations.

6. Acknowledgement
