### **Constrained RESTful Environments** WG (core)

Chairs:

Jaime Jiménez <jaime.jimenez@ericsson.com> Carsten Bormann <cabo@tzi.org> Mailing List: core@ietf.org Jabber: core@jabber.ietf.org

http://6lowapp.net

core@IETF100, 2018-03-19/-20

### • We assume people have read the drafts

- good use of face-to-face communications
- to RFC 8179 and its updates

http://6lowapp.net

## Meetings serve to advance difficult issues by making

# Note Well: Be aware of the IPR principles, according

üBlue sheets üScribe(s)

core@IETF100, 2018-03-19/-20

### **Note Well**

Any submission to the IETF intended by the Contributor for publication as all or part of an IETF Internet-Draft or RFC and any statement made within the context of an IETF activity is considered an "IETF Contribution". Such statements include oral statements in IETF sessions, as well as written and electronic communications made at any time or place, which are addressed to:

- The IETF plenary session
- The IESG, or any member thereof on behalf of the IESG
- auspices
- Any IETF working group or portion thereof
- Any Birds of a Feather (BOF) session
- The IAB or any member thereof on behalf of the IAB
- The RFC Editor or the Internet-Drafts function

All IETF Contributions are subject to the rules of <u>RFC 5378</u> and <u>RFC 8179</u>.

Statements made outside of an IETF session, mailing list or other function, that are clearly not intended to be input to an IETF activity, group or function, are not IETF Contributions in the context of this notice. Please consult <u>RFC 5378</u> and <u>RFC 8179</u> for details.

A participant in any IETF activity is deemed to accept all IETF rules of process, as documented in Best Current Practices RFCs and IESG Statements.

A participant in any IETF activity acknowledges that written, audio and video records of meetings may be made and may be available to the public.

Any IETF mailing list, including the IETF list itself, any working group or design team list, or any other list functioning under IETF

http://www.ietf.org/about/note-well.html

# Agenda Bashing

### Monday (120 min)

- 13:30–13:40 Intro, Agenda, Status
- 13:40–13:50 Post-WGLC: Links-JSON (chairs)
- 13:50–14:20 Post-WGLC: OSCORE (GS)
- 14:20–14:45 Post-WGLC: SenML (AK)
- 14:45–15:15 Up for WGLC soon: RD/DNS-SD (CA)
- 15:15–15:30 Up for WGLC soon: COMI (AP)

All times are in time-warped WET (UTC+00:00)

- 09:30–09:35 Intro, Agenda
- 09:35–10:00 Post-WGLC: CoCoA (CG)
- 10:00–10:15 Getting ready: ERT (CA)
- 10:15–10:25 Getting ready: OSCORE-Group (MT)
- 10:25–10:40 New response codes (AK)
- 10:40–10:55 Pending for EST (PV)
- 10:55–11:05 Pubsub (MK)
- 11:05–11:15 Dynlink/Interfaces (BS)
- 11:15–11:25 Negotiation, AT (BS)
- 11:25–11:35 dev URN (JA)

- 14:20–14:45 Post-WGLC: SenML (AK)
- 15:15–15:30 Up for WGLC soon: COMI (AP)

All times are in time-warped WET (UTC+00:00) Monday (120 min)

• 14:45–15:15 Up for WGLC soon: RD/DNS-SD (CA)

### draft-ietf-core-links-json: Status

- Started Feb 2012 as a JSON version of 6690-to-be
  - Avoid the need for another parser
- Added CBOR variants mid-2015
- Focus: roundtrippable with RFC 6690
  - Inherit limitations of RFC 6690 (e.g., percent-encoding)
- Submitted to IESG on 2017-04-02
  - Lots of feedback
  - Related concepts in OCF spec
- Proposed Re-focus:
  - Still cover all of RFC 6690
- Don't inherit the limitations http://6lowapp.net core@IETF100, 2017-11-13/-14

### Web Linking: RFC 5988 vs. RFC 8288

- RFC 6690 was based on RFC 5988
- Has since been updated to RFC 8288
  - More conscious use of ABNF
  - Clearer approach to Unicode and language tags
- Clarifies role of serialization (of which RFC 6690 is one) RFC 6690 not updated to RFC 8288
- Links-json should use RFC 8288 as a base

### Language tags

- RFC 5988 (and this 8288) defines "starred" attributes Encoding Unicode content, language tag RFC 6690 supports "title", but doesn't do much with
- that
- JSON/CBOR should not be concerned with weird encoding issues
- Language tags are useful for human readable values • So: do support them, but get rid of the "\*" hack:

```
{"href": "...", "rel": "...",
"title": {"de_AT": "Übergrößenträger"}
```

```
core@IETF100, 2017-11-13/-14
```

### Is this the right way forward?

- Rebase on RFC 8288
  - Clean up "title\*" etc.
- documents
- free of RFC 6690 idiosyncrasies
- is RFC 6690 link-format (!?)

Explain how RFC 6690 documents become Links-json

Otherwise, keep Links-json generally applicable and

• Do not change the mandate that "/.well-known/core"

core@IETF100, 2017-11-13/-14

### Monday (120 min)

- 13:30–13:40 Intro, Agenda, Status
- 13:40–13:50 Post-WGLC: Links-JSON (chairs)
- 13:50–14:20 Post-WGLC: OSCORE (GS)
- 14:20–14:45 Post-WGLC: SenML (AK)
- 14:45–15:15 Up for WGLC soon: RD/DNS-SD (CA)
- 15:15–15:30 Up for WGLC soon: COMI (AP)

All times are in time-warped WET (UTC+00:00)

# OSCORE

Göran Selander, Ericsson John Mattsson, Ericsson Francesca Palombini, Ericsson Ludwig Seitz, RISE SICS

16 IETF 101, CoRE WG, London, Mar 19, 2018

draft-ietf-core-object-security-11

### Status (v-11)

### Several implementations

- C (Contiki, Erbium): <u>https://github.com/Gunzter/contiki-oscoap</u>
- Python (aiocoap): <u>https://github.com/chrysn/aiocoap</u>

- Java (Californium, v-03) <u>https://github.com/lukadschaak/oscore</u>

### Several interops done

- Java (Californium): <u>https://bitbucket.org/lseitz/oscoap\_californium</u> - C# (CoAP-CSharp): https://github.com/Com-AugustCellars/CoAP-CSharp - Python (CoAP for openwsn): <u>https://github.com/openwsn-berkeley/coap</u> - C (openwsn-fw): <u>https://github.com/openwsn-berkeley/openwsn-fw</u>

- Spec and reports: https://github.com/EricssonResearch/OSCOAP

### Status (v-11)

- > IETF Last Call ended: IESG evaluation
- Some post-Last-Call reviews
- > Up-to-date handling of review comments on the wiki: https://github.com/core-wg/oscoap/wiki
- > All but a few specific review comments addressed.

- "The document needs a security analysis section"
- > "implications of modifications of unprotected fields"
- > Proposal: Add an appendix describing the security properties of the protocol:
  - Assumptions on intermediaries
  - Protected header fields, security guarantees
  - Unprotected fields, consequences

- > "Nonce construction: Why is Sender ID included in the nonce?"
- > Answer: Designed for supporting notifications and interchange of client and server roles
- > Proposal: Prove (key, nonce) uniqueness in the new appendix

20

- "But this design actively works against any involvement of intermediaries."
- Answer: The design supports intermediaries e.g. performing forwarding and translation
- In the general case, proxies can read but not modify without being detected.
- > Propdsal: Clarify this in the new appendix.

- problem like key exchange"
- > Answer: Key establishment is addressed. - The ACE/OAuth 2.0 framework may be used. - Some IoT deployments require PSK.
- IETF#95.

\* "neglecting to address important and difficult parts of the

> Key exchange for OSCORE is discussed in ACE since

### Review Comments: HTTP 1(2)

- "This protocol abuses HTTP by tunneling over it" > Answer: Yes. This was requested.
- > "Missing [A]BNF"
- > Answer: Agreed, included
- > "Does the COAP-HTTP gateway understand the type when translating? "
- > Answer: Yes

significance of the new header field and insert the media

### Review Comments: HTTP 2(2)

- > "A new media type is defined, but I don't see any mention of a codepoint for use with COAP"
- > Proposal: Not needed for this draft, but will include that for other potential use
- > "What if the request is redirected by a server that doesn't understand OSCORE?"
- > Question for WG: shall we support HTTP redirects?

24

- > Question for WG: Rename HTTP header field: > 'Object-Security'  $\rightarrow$  'CoAP-Object-Security'

### **Reviews Comments: Summary** Proposal

- Clarifications of the points brought up
- > Editorials
- > New appendix:
  - <u>D. Overview of Security Properties</u>
    - > D.1. <u>Supporting Proxy Operations</u>
    - D.2. Protected Message Fields
    - > D.3. Uniqueness of (key, nonce)
    - > D.4. Unprotected Message Fields

### Details on the CoRE WG Github Commits

# Media Types for Sensor Measurement Lists (SenML)

27

- IETF 101, London
- draft-ietf-core-senml-13
  - Ari Keränen

### Status

- Done!
  - IETF LC ongoing
  - IESG Telechat April 19<sup>th</sup>
- Since -12: "+exi" -> "-exi" & editorial fixes
- have "Value" in the long name

Still: could add expert guidance clarification for new values: must

### Early assignments

 Suggested CoAP Content-Format IDs • XML IDs in 2-byte range

> Media type application/senml+json application/sensml+json application/senml+cbor application/sensml+cbor application/senml-exi application/sensml-exi application/senml+xml application/sensml+xml

29

### Early assignments

How about SenML Fields?

30

# Media types for FETCH & PATCH with SenML

31

- IETF 101, London
- draft-keranen-senml-fetch-00
- Ari Keränen & Mojan Mohajer

### SenML IPSO SO example

[{"bn":"2001:db8::2/3306/0/", "n":"5850", "vb":true}, {"n":"5851", "v":42}, {"n":"5852", "v":1200},

32

{"n":"5750", "vs":"Ceiling light"}]

### SenML IPSO SO example

- Want to retrieve/change only 5850 and 5851
  And want to avoid exchanging full representations
- And want to avoid exchange or doing multiple requests

### COAP FETCH / PATCH (RFC 8132)

- and update parts of a resource
- format

34

CoAP methods, FETCH, PATCH, and iPATCH, which are used to access

Needs payload format; dependent on the resource representation

### SenML FETCH format

- Modeled after SenML JSON for things with SenML support
- Just indicate names, and potent fetch

[ {"bn":"2001:db8::2/3306/0/", "n":"5850"}, {"n":"5851"} ]

Modeled after SenML JSON format: simple parsing on constrained

Just indicate names, and potentially times, of the SenML records to

### SenML PATCH format

- Same as FETCH format, but with the value(s) to set
  - Essentially a subset of the JSON Merge Patch format

36

n the value(s) to set Merge Patch format

# Wild cards

- Optimization for selecting many SenML Records with one FETCH/PATCH Record
- on a device)

37

- "Get all temperature sensor values"
- "Dim all lights to 10%"

• Useful with large amounts of SenML Records (e.g., many IPSO objects

# Proposed format

- New SenML Field "ff" ("fetch filter")
  - name field
  - Contains wild card characters "\*"
  - Matched to SenML Record Names
- Wild card matches all characters until next "/" or ":"

# • Used instead of the name field and concatenated to base name like the

### [{"bn":"2001:db8::2/", "ff":"3306/0/58\*"}]

(This matches all records in the example except "3306/0/5750")

# (Wild Card) Considerations

- Need something **simple** now: constrained devices
  - Wild card **seemed** most suitable
- Using new Field(s) enables easy extensibility
  - Alternative: re-purpose "n" and "bn" fields
- Should wild card support be MUST?
  - doesn't seem right
- How to indicate "not supporting wild cards"? Now suggesting "4.00 Bad Request" but • Regular expressions? New field probably

39

- PATCH operation codes needed (append, delete, ...)?
- Can just re-use SenML content format IDs?
- Interest in CoRE WG to work on this?

# Monday (120 min)

- 13:30–13:40 Intro, Agenda, Status
- 13:40–13:50 Post-WGLC: Links-JSON (chairs)
- 13:50–14:20 Post-WGLC: OSCORE (GS)
- 14:20–14:45 Post-WGLC: SenML (AK)
- 14:45–15:15 Up for WGLC soon: RD/DNS-SD (CA)
- 15:15–15:30 Up for WGLC soon: COMI (AP)

All times are in time-warped WET (UTC+00:00)

#### ▲□▶▲□▶▲≡▶▲≡▶ ●○ ◇◇◇

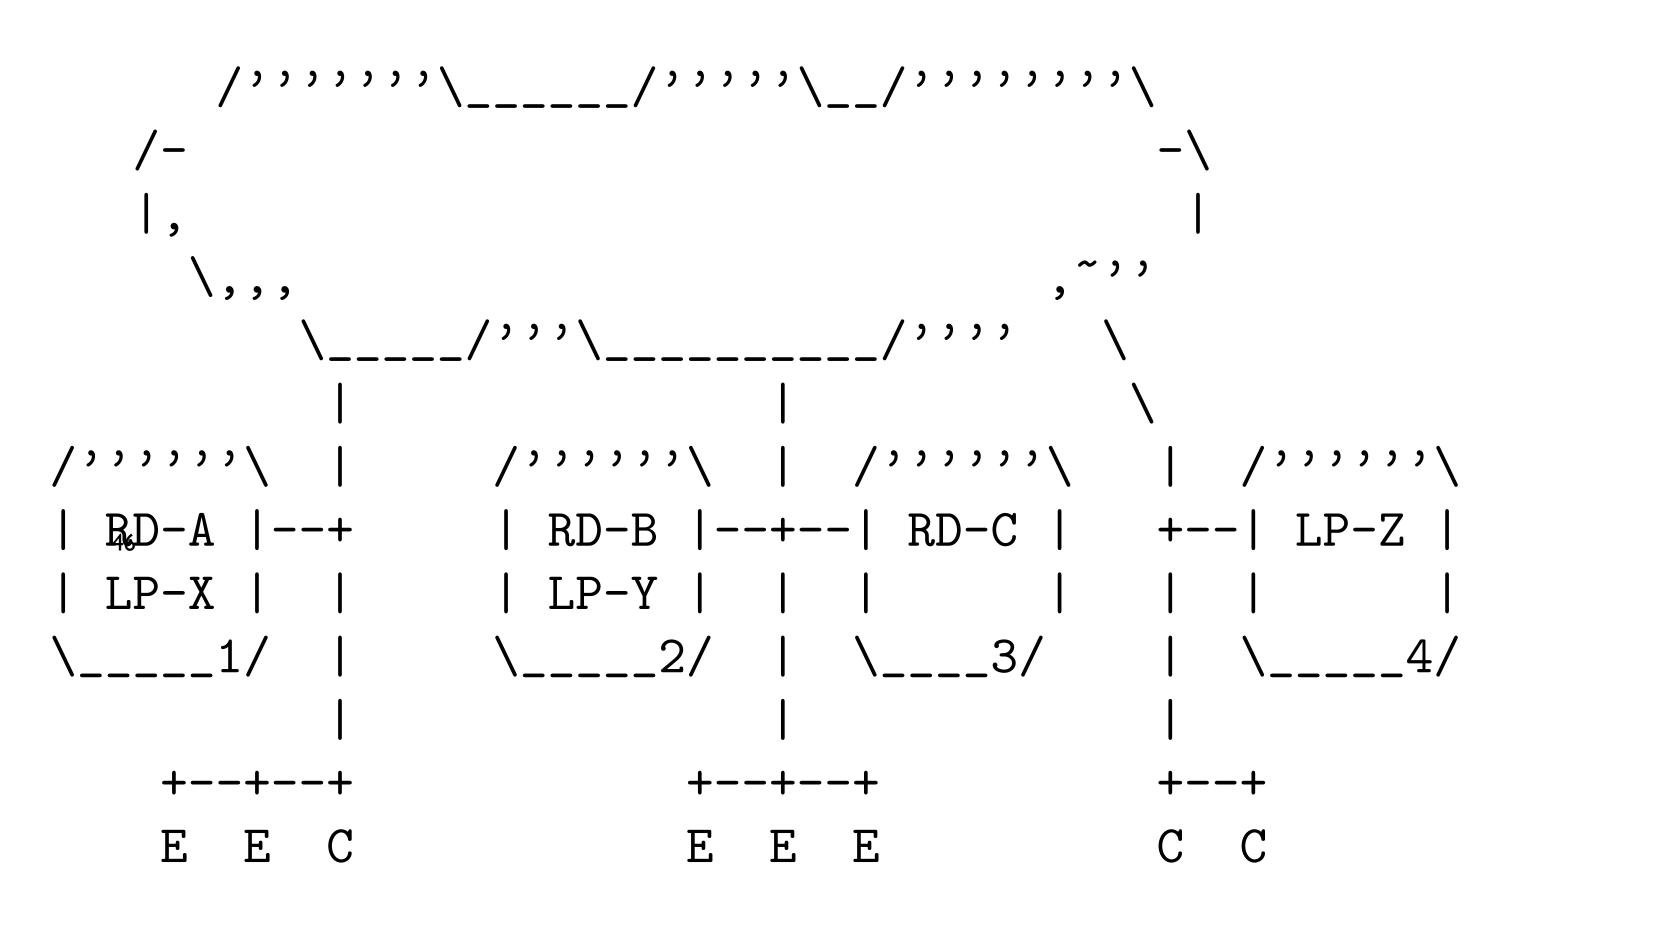

### Changes since -12

- Cleanup and clarification
  - Clarified observation behavior
  - Refer to t2trg-rel-impl for server metadata / versioning
  - Reduced the significance of domains (removed from figure 2)
- Added "all resource directory" nodes MC address
- Resolve RFC6690-vs-8288 resolution ambiguities
  - Require registered links not to be relative when using anchor Return absolute URIs in resource lookup
- Work with replication without really changing the RD
  - Multiple RDs can be found, and can have absolute addresses
  - Endpoints from other RDs can be members of a group

#### ▲□▶▲□▶▲≡▶▲≡▶ ▲□ ♪ � ♀ ?

### rd-replication

- Different registration addresses
- Different lookup addresses
- Eventually consistent results

# Secure group communication for CoAP draft-ietf-core-oscore-groupcomm-01

# 66

IETF 101, CoRE WG, London, March 20<sup>th</sup>, 2018

Marco Tiloca, RISE SICS Göran Selander, Ericsson Francesca Palombini, Ericsson Jiye Park, Universität Duisburg-Essen

# Updates from -00 (1/2)

Major updates and restructuring to address reviews -Thanks to Esko Dijk and Peter van der Stok

- > Section 1.1 Terminology
  - Added definition of group as "security group"
  - Not to be confused with "network group" or "application group"

- Section<sup>6</sup>2 Security Context
  - Clarified establishment/derivation of contexts
  - Added table for additional elements wrt OSCORE

# Updates from -00 (2/2)

### Section 3 – COSE Object

- Examples or request and response (before and after compression)
- CounterSignature0 is used rather than CounterSignature
- 'external aad' includes also the signature algorithm
- 'external aad' does not include the Group Identifier (Gid) any more

### Section 6 – NEW

List of responsibilities of the Group Manager

### > Appendices

- Appendix A: assumptions and security objectives (former section) Appendix B: additional details on considered use cases Appendix C: added actual example of Gid format (prefix + epoch) – Appendix D: join description aligned with *draft-palombini-ace-key-groupcomm*

# Points for discussion (1/2)

- Independence of Security Group from IP addresses

### Fixed part of the Gid

- Change to neglect randomness and large size ?

- Requests may be multicast or unicast (e.g. selective retransmissions) Current context retrieval based on Gid and multicast IP address – Change to use only the Gid as kid context for context retrieval ?

 Currently random and large enough to avoid global collisions – Tie-breaker can be trying the keying material from multiple contexts

# Points for discussion (2/2)

- > Current terminology explicitly points at multicast
  - Replace "Multicaster" with "Sender" ?
  - Replace "(Pure) Listener" with "(Pure) Recipient"?
  - This would simplify request/assignment of roles upon joining

- > Current description of the join process
  - Appendix D.1: exchanged information
  - Appendix D.2: provisioning/retrieval of public keys
  - Appendix D.3: pointer to the ACE-based approach
  - What should be kept in this document?
  - Should we keep a general description in case ACE is not used?

# Implementation

### **>** OSRAM Innovation

- Developed in C
- MediaTek Linklt Smart 7688 – Aligned with individual submission at IETF99
- > Proof-of-concept for Contiki OS
  - Wismote (MSP430; TI CC2520)
  - SmartRF (MSP430; TI CC2538)
  - Aligned with individual submission at IETF99
  - <u>https://github.com/tdrlab/mcast</u>
- > Next steps
  - Move forward to interoperability tests
  - Is it feasible already at IETF102?

# **Related activity**

# Too Many Requests Response Code for CoAP

76

- IETF 101, London
- draft-keranen-core-too-many-reqs-00
  - Ari Keränen

## Background

- CoAP client can cause overload in server with too frequent requests
- How can server tell client to back off
- HTTP error code 429 "Too many requests"
- Proposal: register 4.29 for CoAP
  - With MaxAge to indicate when it's OK to request again
- Originally part of CoAP Pub/sub Broker draft; also OCF interest

## What requests are OK?

- Current text: Client "SHOULD NOT send the same request to the server before the time indicated in the Max-Age option has passed" • Other requests? Should server be able to give guidance what else is
- (not) OK during this time?
  - Example: GET instead of PUBLISH
- Sounds like a generic problem worth a generic solution; probably out of scope for this draft

## Next steps

- Bundle with other non-controversial Response Codes?
- WG item?

79

### • We assume people have read the drafts

- good use of face-to-face communications
- to RFC 8179 and its updates

### **Note Well**

Any submission to the IETF intended by the Contributor for publication as all or part of an IETF Internet-Draft or RFC and any statement made within the context of an IETF activity is considered an "IETF Contribution". Such statements include oral statements in IETF sessions, as well as written and electronic communications made at any time or place, which are addressed to:

- The IETF plenary session
- The IESG, or any member thereof on behalf of the IESG
- auspices
- Any IETF working group or portion thereof
- Any Birds of a Feather (BOF) session
- The IAB or any member thereof on behalf of the IAB
- The RFC Editor or the Internet-Drafts function

All IETF Contributions are subject to the rules of <u>RFC 5378</u> and <u>RFC 8179</u>.

Statements made outside of an IETF session, mailing list or other function, that are clearly not intended to be input to an IETF activity, group or function, are not IETF Contributions in the context of this notice. Please consult <u>RFC 5378</u> and <u>RFC 8179</u> for details.

A participant in any IETF activity is deemed to accept all IETF rules of process, as documented in Best Current Practices RFCs and IESG Statements.

A participant in any IETF activity acknowledges that written, audio and video records of meetings may be made and may be available to the public.

Any IETF mailing list, including the IETF list itself, any working group or design team list, or any other list functioning under IETF

# **CoAP Simple Congestion Control/Advanced** (CoCoA)

## draft-ietf-core-cocoa-03

- Carsten Bormann Universität Bremen TZI
  - August Betzler Fundació i2Cat
- Carles Gomez, Ilker Demirkol Univ. Politècnica de Catalunya

## Status

- WG state: "Submitted to IESG for publication"
- Last revision is -03
  - Mostly editorial updates
  - Addresses comments by:
    - Wesley Eddy (TSVART Early Review)
    - Mirja Kühlewind (Responsible AD)
- Next revision
  - Needs to address comments by:
    - Scott Bradner (OPSDIR Telechat Review)
    - Vincent Roca (SECDIR Review)
    - Christer Holmberg (Gen-ART Telechat Review)

# Updates in -03 (I)

- Section 1
  - Paragraph previously in Section 5, now more general: overview on CoCoA
    - RTO based on (weak or strong) RTTs
    - Weak RTTs: reaction to congestion with a lower sending rate
    - For NONs, sending rate limited to 1/RTO
      - More conservative than RFC 7641 (Observe): 1/RTT

# Updates in -03 (II)

- Section 3
  - Added details on scenarios where CoCoA has been found to perform well
    - Latencies: milliseconds to peaks of dozens of seconds
       Comment from Jaime: which reference contributes to what
      - Comment from Jaim within this range
    - Single-hop and multihop network topologies
    - Link technologies: IEEE 802.15.4, GPRS, UMTS, Wi-Fi
  - Added that CoCoA is also expected to work suitably across the general Internet

# Updates in -03 (III)

- Section 4.2
  - in evaluations (Appendix A)

- Section 4.2.1
  - simple exponential backoff

 Added that default weight values for strong and weak RTO estimators have been found to work well

Added an explicit note on VBF replacing RFC 6298

# Updates in -03 (IV)

- Section 4.3
  - State of RTO estimators for an endpoint
    - Should be kept long enough to avoid frequent returns to inappropriate initial values
    - For default parameters in CoAP, it is RECOMMENDED to keep it for at least 255 s
      - Was a "MUST" in -02
- Minor editorial updates throughout the document

# Next revision (I)

- Scott Bradner's comment
   The draft makes no reference to RFC 5033...
  - "Specifying New Congestion Control Algorithms"
  - ... But we have taken RFC 5033 into account in the design of CoCoA

# Next revision (II)

- RFC 5033 guidelines
  - 0. Differences with congestion control principles (RFC 2914)
    - congestion collapse, fairness, optimizing performance)
  - CoCoA design considers such principles (preventing) – 1. Impact on standard TCP, SCTP, DCCP
    - No negative impact
  - 2. Difficult environments
    - CoCoA has been designed for "difficult environments"
  - 3. Investigating a range of environments
    - Done (see slide 4)

# Next revision (III)

- RFC 5033 guidelines
  - 4. Protection against congestion collapse
    - VBF of 1.5, 2 or 3 (always greater than 1)
  - 5. Fairness within the alternate cong. control mech.
    - High fairness measured (thanks to the VBF)
  - 6. Performance with misbehaving nodes
    - Considered. Weak estimator role
  - 7. Responses to sudden or transient events
    - CoCoA restores "normal" network state quickly
  - 8. Incremental deployment
    - CoCoA runs correctly in current CNNs and in CNN-cloud

## Thanks!

Carsten Bormann – Universität Bremen TZI cabo@tzi.org August Betzler, <u>Carles Gomez</u>, Ilker Demirkol Universitat Politècnica de Catalunya carlesgo@entel.upc.edu

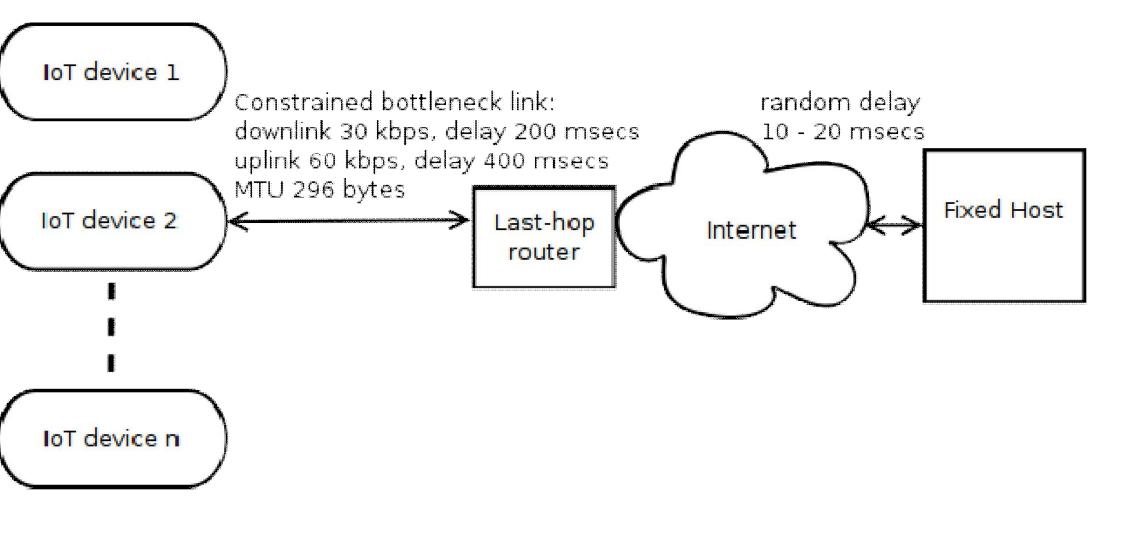

## Experimental Results with Default CoAP, CoCoA and CoAP over TCP RTO Management & Congestion Control

96

- Ilpo järvinen, livo Raitahila, Laura Pesola, Zhen Cao<sup>§</sup>, Markku Kojo
  - **Department of Computer Science** University of Helsinki
    - <sup>§</sup> Huawei

## System under Study

- 1 to 400 IoT devices communicate with a fixed host over a constrained link
- Emulated wireless NB-IoT like network
- Varying router buffer sizes
  - 2500 B (recommended ~ BDP of the link)
  - 14100 B <sub>97</sub>
  - 28200 B
  - 1410000 B ("infinite", extreme buffer bloat)

## Transport & Congestion Control

- Client and server implemented using libcoap
- Default CoAP as implemented in libcoap (+some bugfixes)
- CoCoA implemented as per draft-ietf-core-cocoa-01 and draft-ietf-core-cocoa-03
- For Default CoAP and CoCoA

  - MAX RETRANSMIT = 20 (EXCHANGE\_LIFETIME and MAX\_TRANSMIT\_WAIT adjusted accordingly) • Max RTO: 60 secs, 32 secs for CoCoA as specified
- Implemented CoAP over TCP as per draft-ietf-core-coap-tcp-tls-09 • Only necessary features implemented
- - Run on top of Linux TCP
- Linux TCP (modified)

  - Use NewReno, Disabled: SACK, Cubic, Timestamps, F-RTO, CBI • Experimental features disabled: TCP RACK, TFO
  - Initial RTO: 2 secs
  - Delayed Ack timer: constant 200 msec
  - SYN and SYN/ACK retries: 40 and 41
  - Max RTO: 120 secs (Linux default)

### Workloads

- Small request-response exchanges
- Request and response both fit in one CoAP message
- 1, 10, 50, 100, 200, 400 simultaneous client-server pairs (flows)
- Two types of clients:
  - **Continuous**: 50 successful request-reply exchanges
    - TCP connection for each client is pre-established and the three-way  $\bullet$ handshake is not included in the measurements
  - $\bullet$ 
    - <sup>9</sup>A short-lived random client sends 1-10 requests followed by another ulletrandom client until 50 request-response pairs successfully exchanged
- Retransmission timer reinitialized for each new random client
  - A new TCP connection opened for a new random client

### **Random**: emulates short-lived clients (Random clients)

### Flow Completion Time (FCT) - 1 and 10 Clients

### Table 1: Flow completion time (FCT) of **1 Continuous** Client (secs)

Buffer Size	CC algorithm	Min	10	25	Median	75	90	max
2500B	Default CoAP	33.003	33.003	33.003	33.003	33.003	33.003	33.003
2500B	СоСоА	33.002	33.003	33.003	33.003	33.003	33.003	33.003
2500B	CoAP over TCP	33.208	33.208	33.208	33.208	33.208	33.208	33.208

### Table 2: Flow completion time (FCT) of **1 Random** Client (secs)

<b>Buffer Size</b>	CC algorithm	Min	10	25	Median	75	90	max
2500B	Default CoAP	33.003	33.003	33.003	33.003	33.003	33.003	33.004
2500B	СоСоА	33.003	33.003	33.003	33.003	33.003	33.003	33.004
2500B	CoAP over TCP	41.900	41.924	43.590	45.584	46.239	46.417	46.580

### Table 3: Flow completion time (FCT) of **10 Continuous** Clients (secs)

Buffer Size	CC algorithm	Min	10	25	Median	75	90	max
2500B	Default CoAP	33.043	33.044	33.126	33.220	33.300	33.335	33.387
2500B	СоСоА	33.043	33.044	33.126	33.220	33.299	33.334	33.387
2500B	CoAP over TCP	33.236	33.243	33.343	33.440	33.521	33.571	33.616

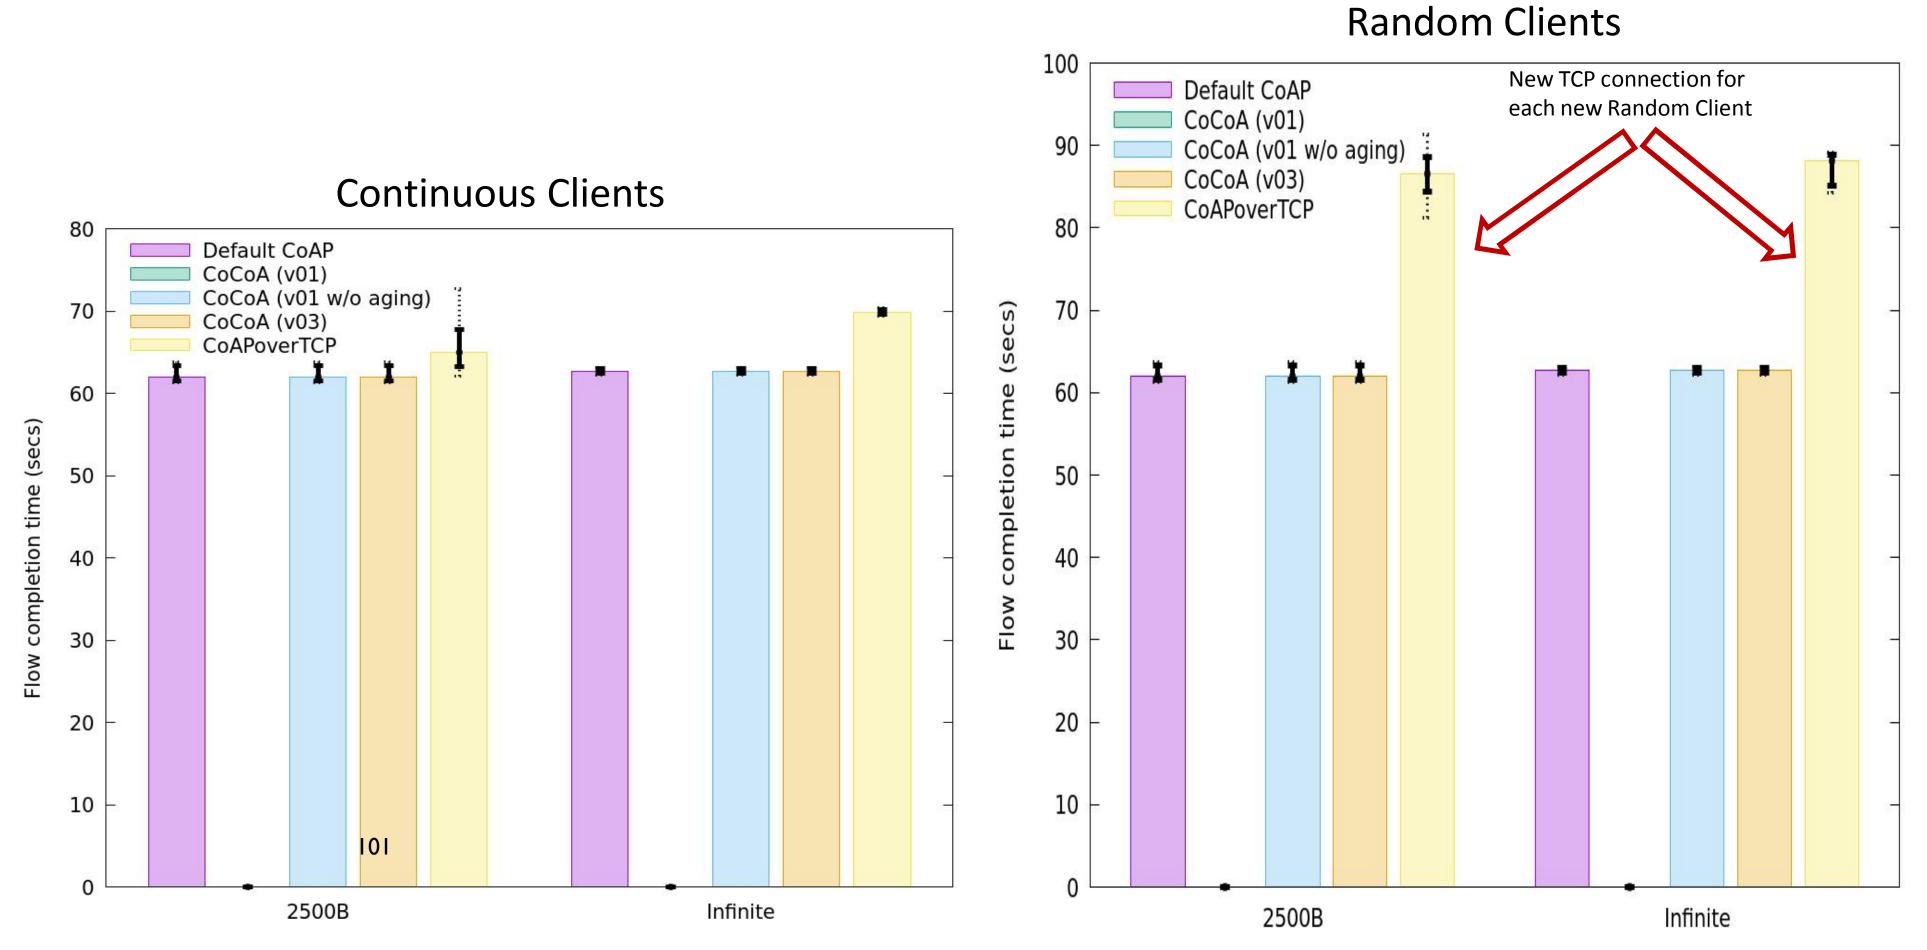

### Table 4: Flow completion time (FCT) of **10 Random** Clients (secs)

Buffer Size	00C algorithm	Min	10	25	Median	75	90	max
2500B	Default CoAP	33.044	33.044	33.126	33.220	33.300	33.335	33.387
2500B	СоСоА	33.043	33.044	33.126	33.220	33.300	33.335	33.387
2500B	CoAP over TCP	40.494	43.245	43.821	46.166	46.663	46.872	47.202

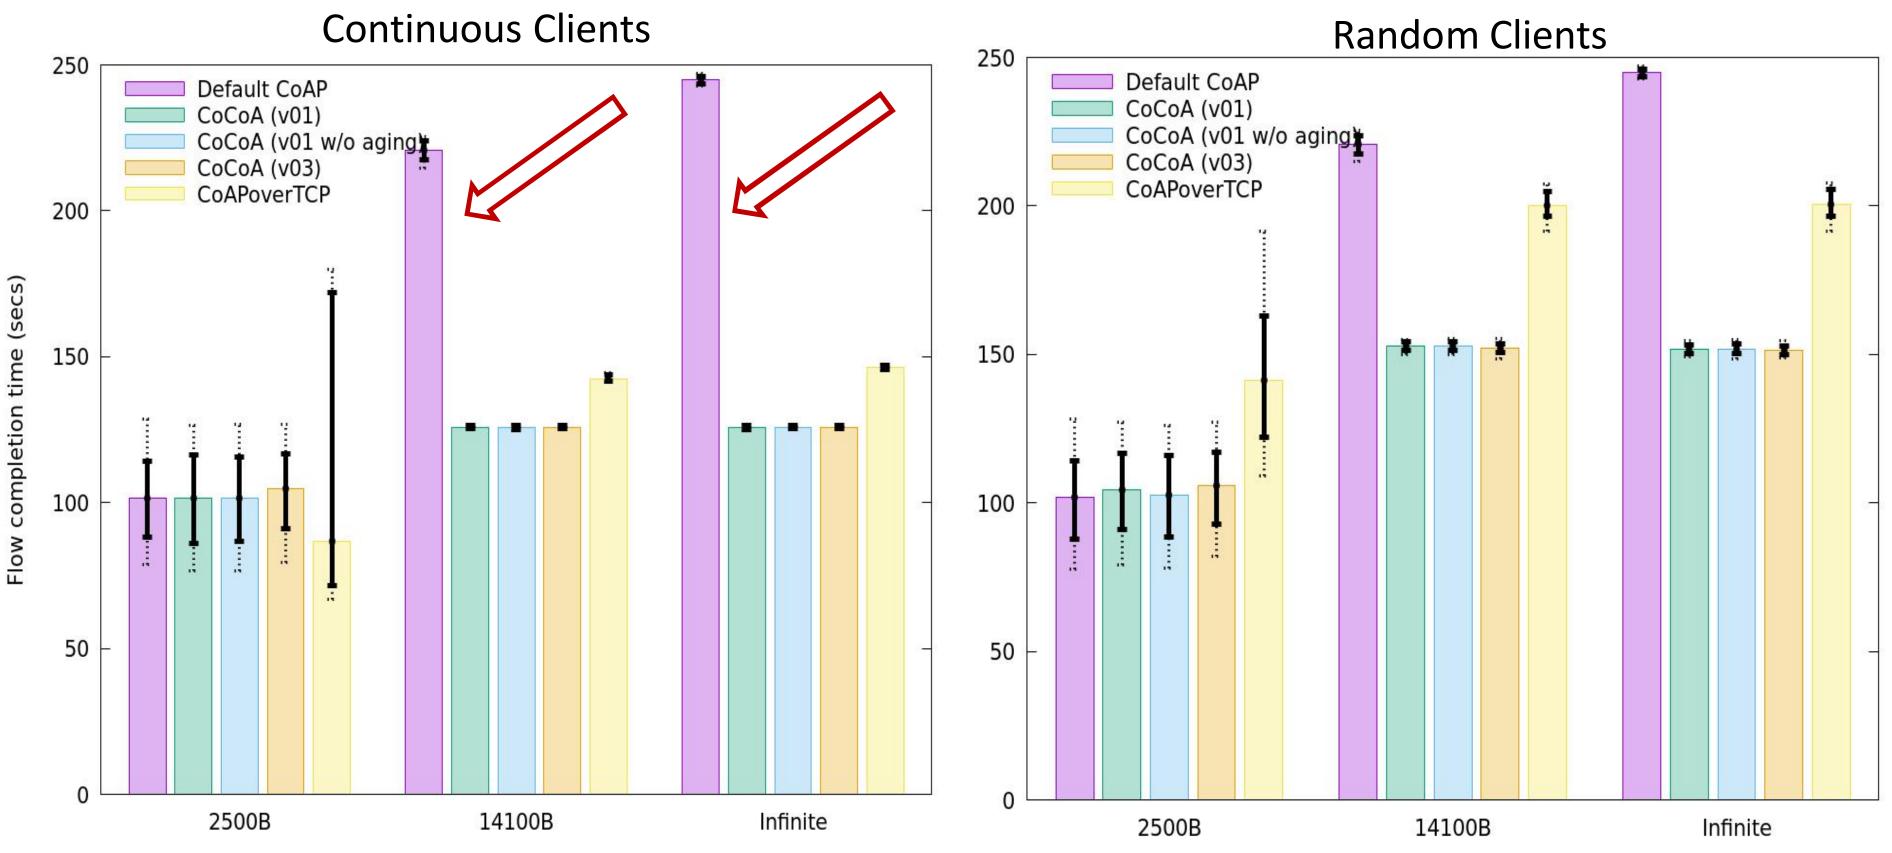

- Larger TCP header causes some additional overhead for CoAP over TCP
- Queuing delay increases the flow completion times of 10 clients by up to a few hundreds milliseconds

• With CoAP over TCP Random clients are clearly slower to complete compared to Continuous clients due to an additional RTT for TCP 3WHS when a new random client starts

## FCT - 50 Clients

- Queuing delay increases and some congestion occurs resulting in a few packet losses
  - The major reason for the increased FCT is still in increased queuing delay
  - CoAP over TCP flows that encounter drops retransmit & back off -> FCT increases at higher percentiles
- "Infinite" queue: can absorb more packets eliminating packet losses with TCP
  - TCP more stanble, but slightly increased queuing delay because packets dropped with small buffer now fit into the buffer

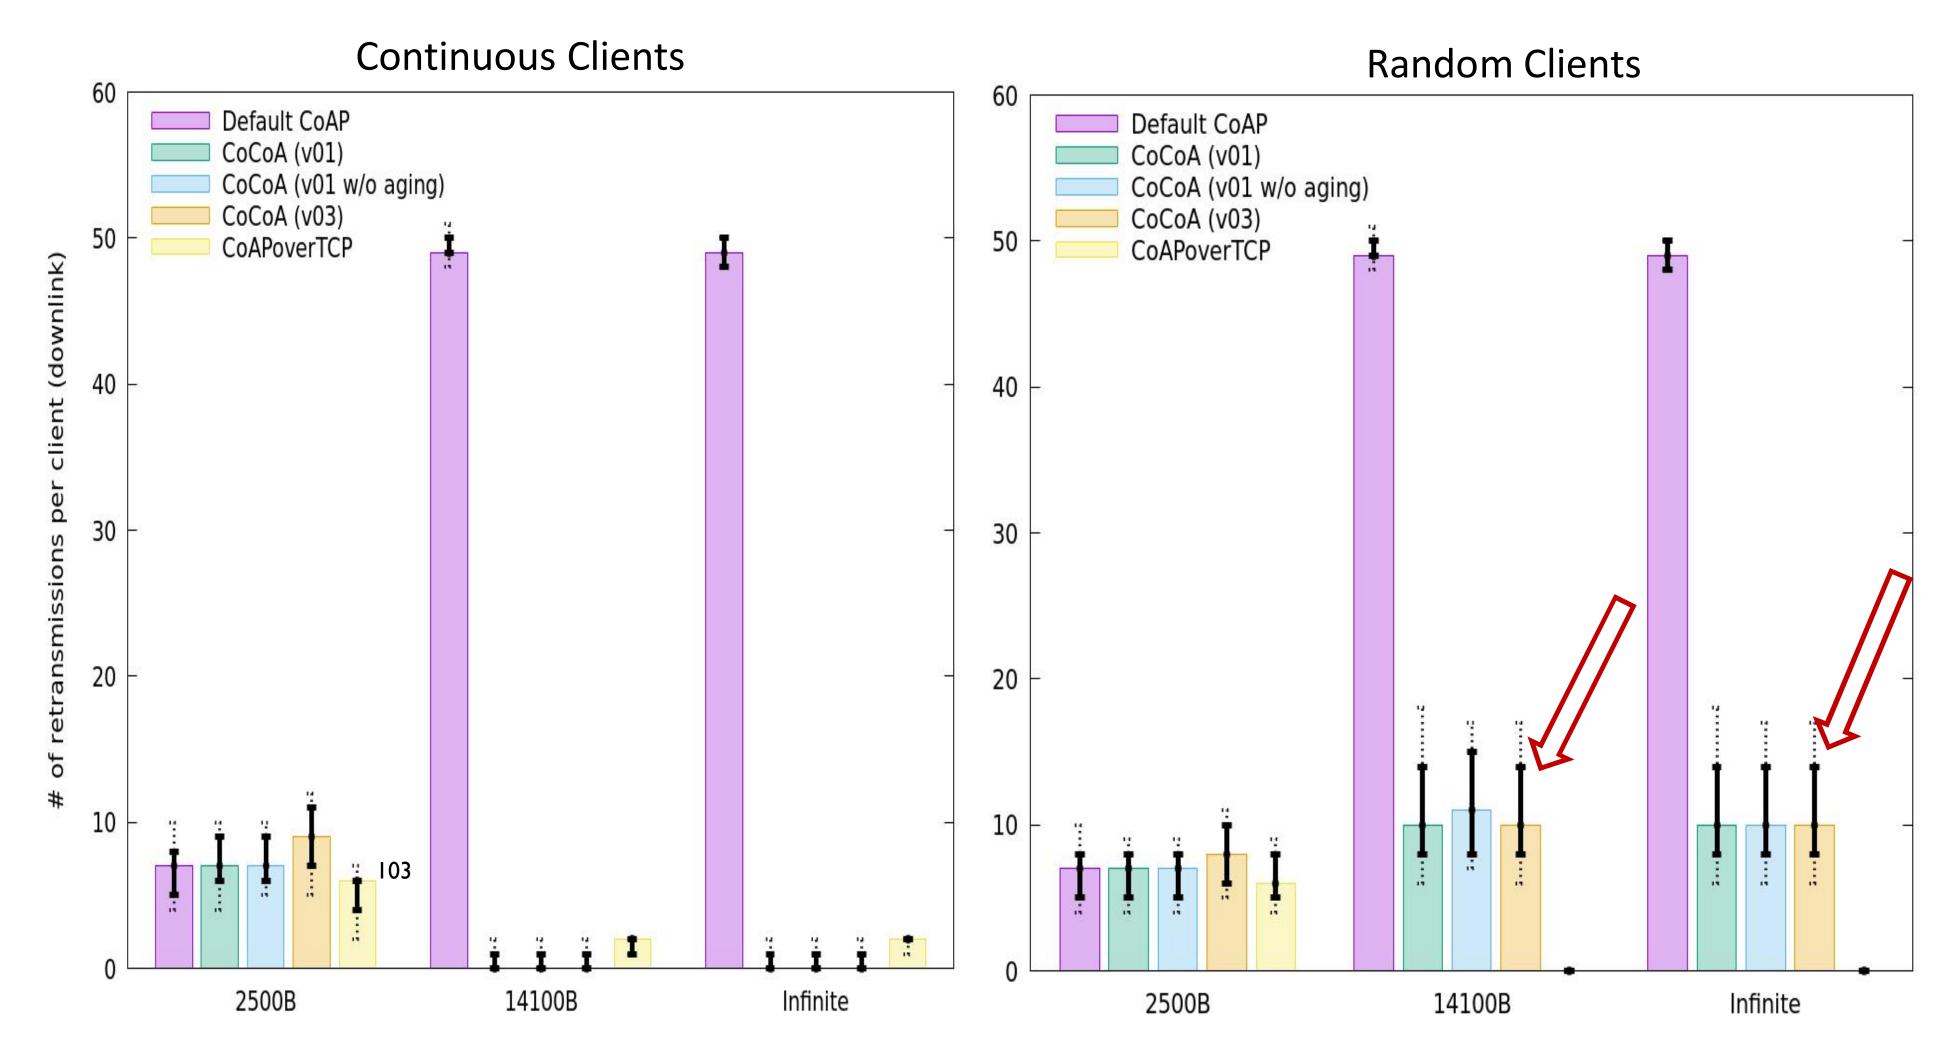

- - Unnecessary retransmissions with initial RTO
  - Default CoAP FCT increases significantly

    - Default CoAP unable to adjust its RTO unlike CoCoA and CoAP over TCP Cannot avoid unnecessary retransmissions

### FCT - 100 Clients

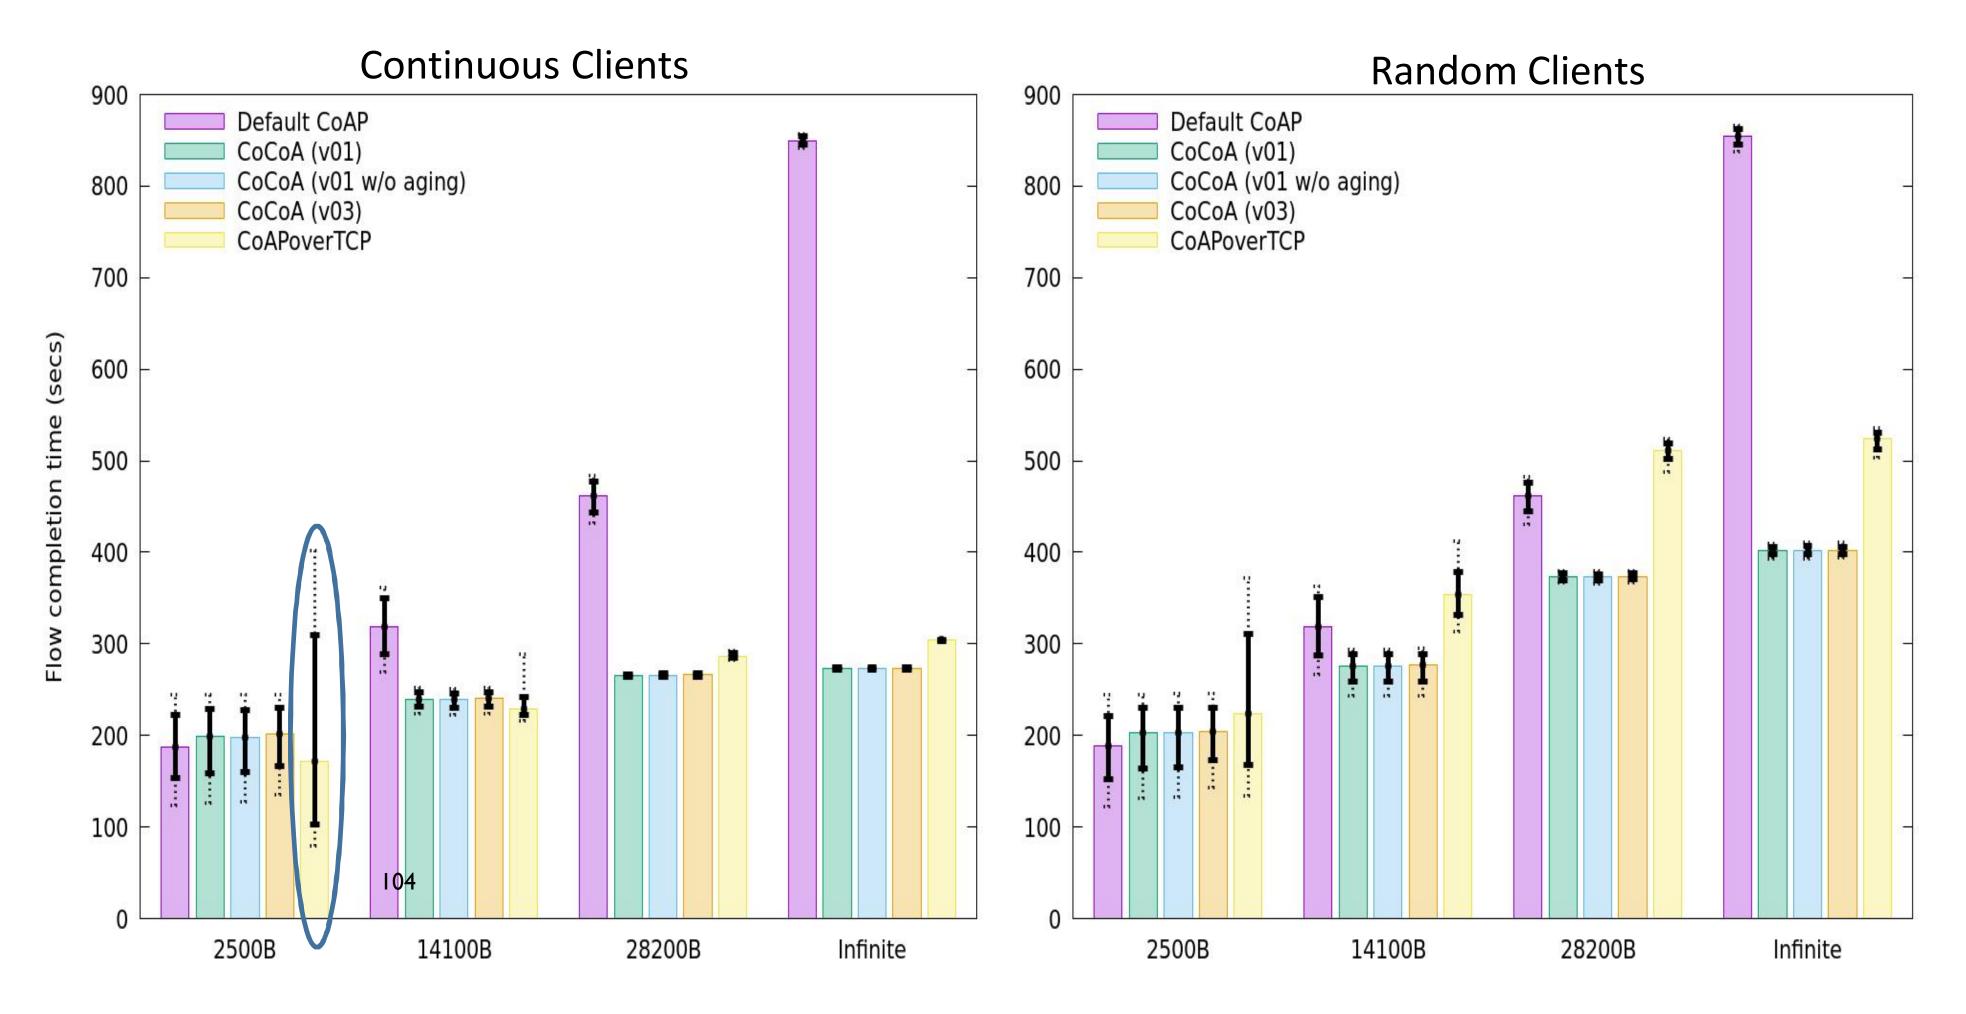

• Larger router buffers: longer queuing delay takes RTT over 2,5 secs

### Number of retransmissions - 100 Clients

- CoCoA and CoAP over TCP able to adjust RTO
  - CoCoA has more difficulties in adjusting RTO with Random Clients

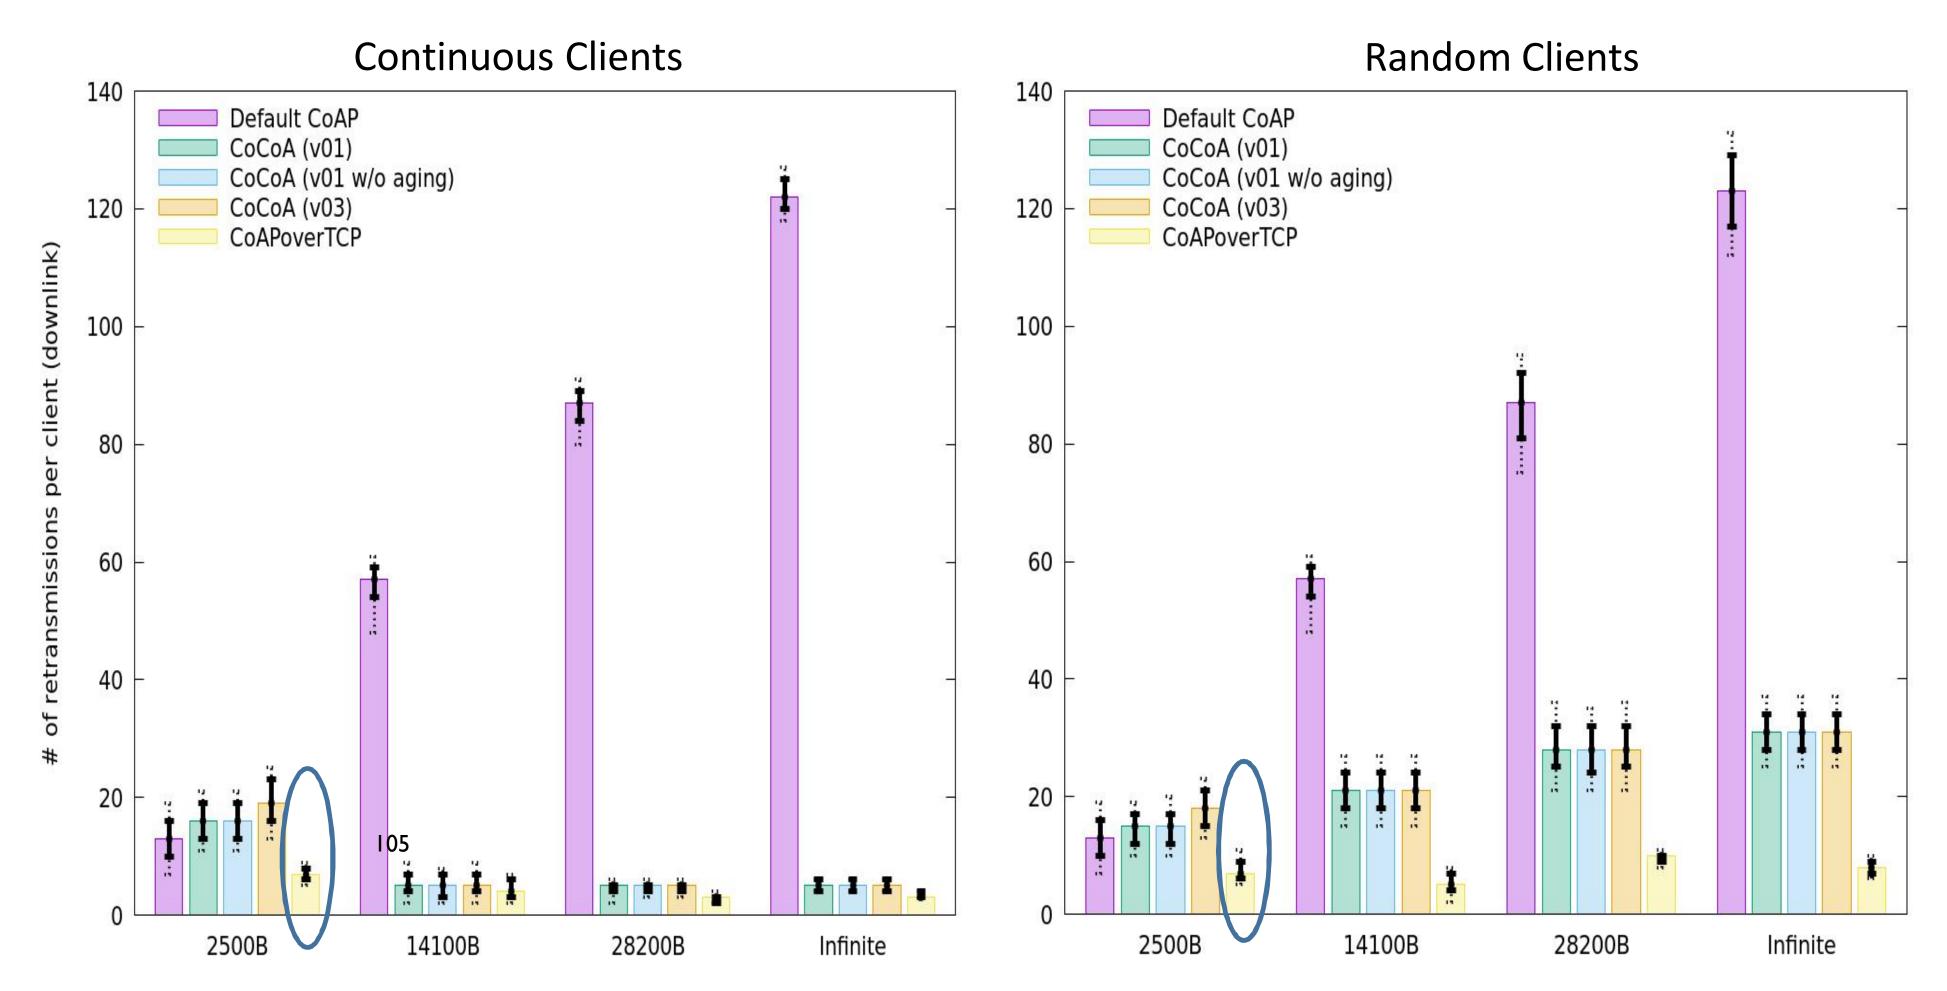

• With larger buffers Default CoAP unnecessarily retransmits nearly every requests once

- Default CoAP Congestion Collapsive behavior with infinite buffer
  - A vast number of unnecessary retransmissions add to the queuing delay
- With smaller 2500 B buffer TCP responds congestion more effectively

### FCT - 200 Clients

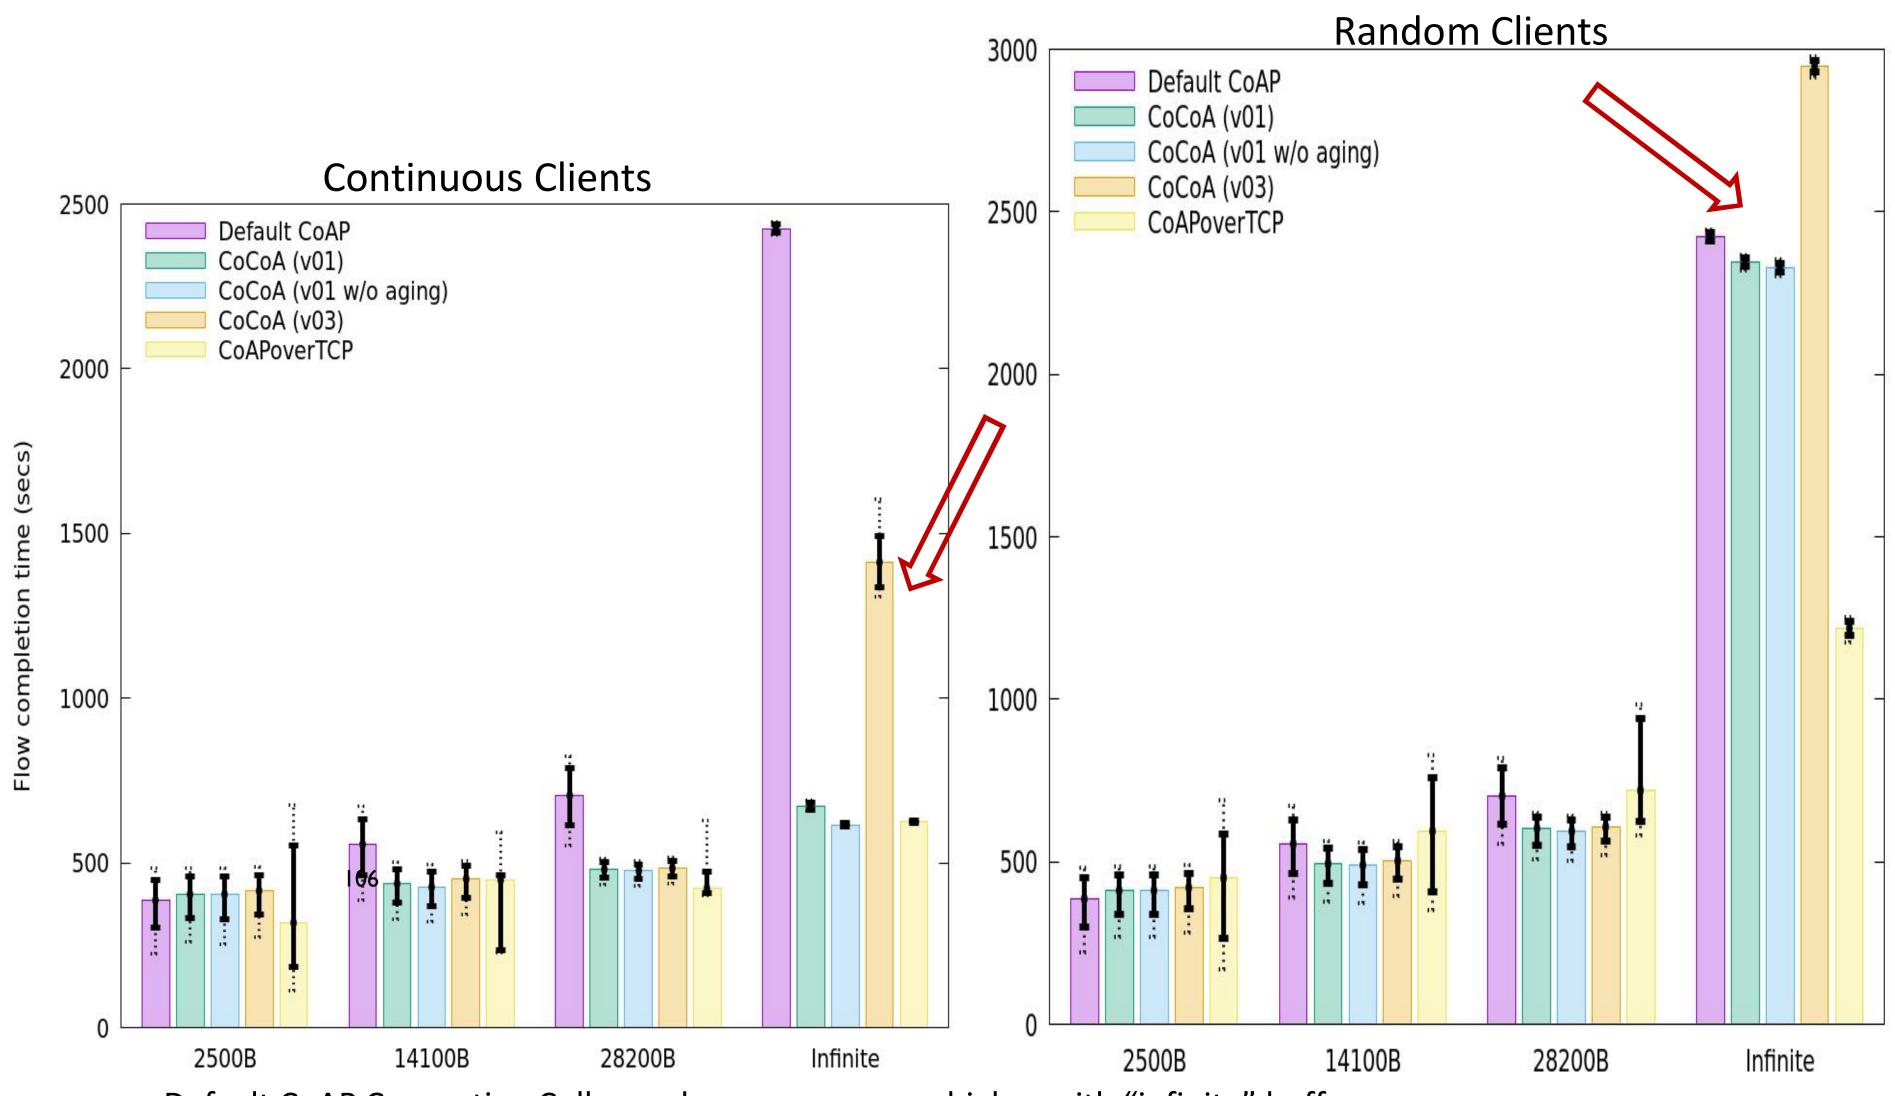

### Number of Retransmission – 200 Clients

- Default CoAP: degree of Congestion Collapse increases with infinite buffer
- With smaller 2500 B buffer CoAP over TCP has clearly less lost packets & retransmissions

• Less forward progress made as most requests are unnecessarily retransmitted at least twice

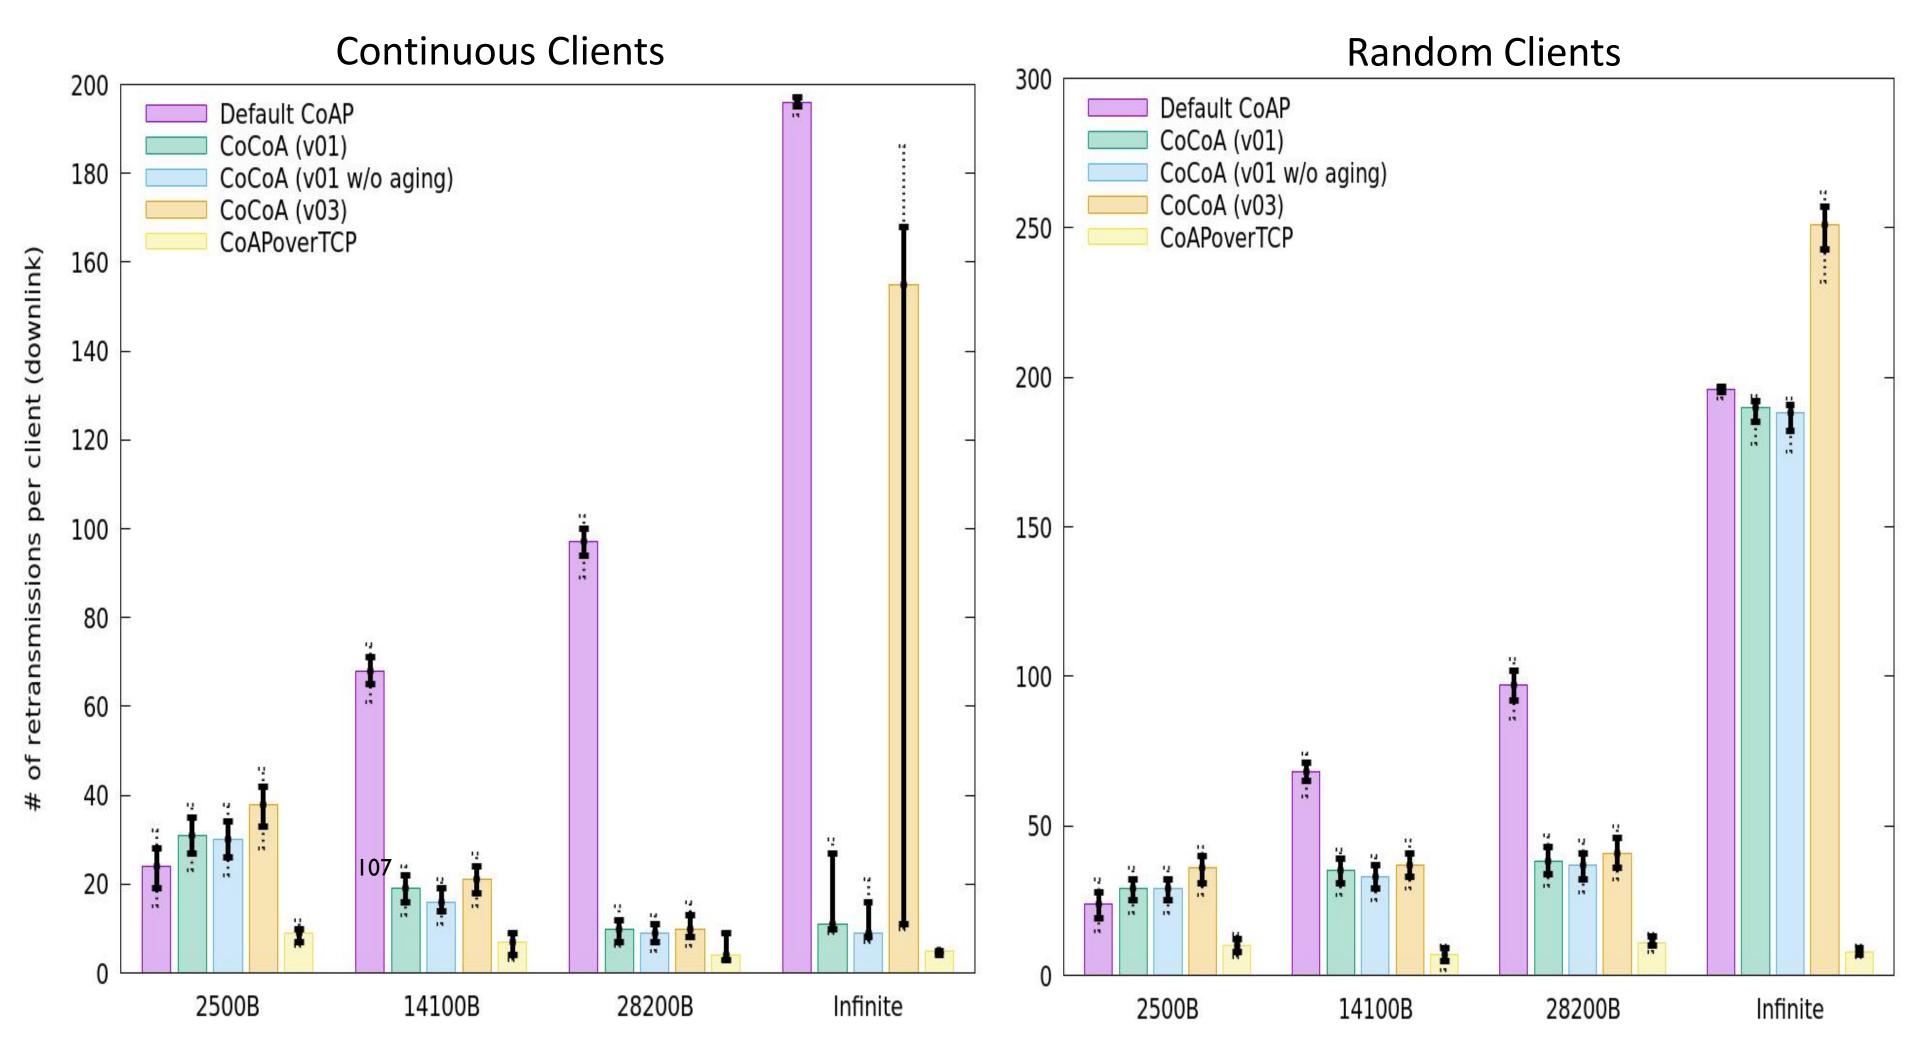

• This decreases the congestion level and allows TCP to complete with a lower number of retransmissions than Default CoAP and CoCoA that have more undelivered retransmissions

- Default CoAP Congestion Collapse degree even more higher with "infinite" buffer
- CoCoA -03 starts to collapse with Continuous Clients & "infinite" buffer
- Both CoCoA -01 and CoCoA -03 collapse with Random Clients & "infinite" buffer

### FCT - 400 Clients

• Little forward progress made as almost all requests are unnecessarily retransmitted several times

- CoCoA –v03 with Continuous Clients & "infinite" buffer:
  - RTT increases well above 10 secs -> Bit more than half of the clients are not able to adjust RTO
  - VBF of 1.5 does not allow CoAP exchanges with initial RTO (2-3 secs) to complete with 2 rexmits
  - Many clients that manage to get weak sample and RTO > 3 secs suffer from aging
  - CoCoA RTO has upper bound of 32 secs

Number of Retransmissions - 400 Clients

## Protocol Actions Needed

- Problems with Default CoAP (RFC 7252)
  - Does not employ full back off that is TCP-compatible
- Problems with CoCoA
  - Does not employ full back off that is TCP-compatible
  - With RTO estimate > 3, applies aging that blindly decreases RTO estimate • Even if increase would be appropriate
  - consider)
- RFC 7252):
  - congestion control back off (TCP-compatible):
    - After retransmitting and backing off RTO, retain the backed off RTO as initial RTO for the next new CoAP message exchange (CON-ACK)
    - Back off RTO further, if retransmissions needed
    - Restore RTO only after no retransmissions are needed to complete CoAP message exchange
  - CoCoA: Reconsider the use of aging with RTO > 3
  - CoCoA: Reconsider the use of 32 secs upper bound for RTO

• After retransmitting and backing off, restores 2 secs initial RTO for the next exchange

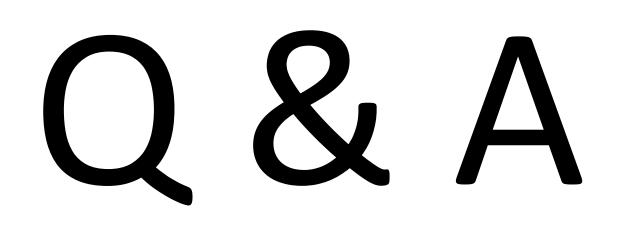

• After retransmitting and backing off, starts the next exchange with current RTO estimate

• Applies upper bound of 32 secs for RTO (in conflict with draft-ietf-tcpm-rto-

### • Action points (edit draft-ietf-core-cocoa; write a short I-D that updates

• Default CoAP and CoCoA: With confirmable message exchanges, add full

## Thank You!

## Draft-ietf-core-dev-urn-01

Arkko, Jennings & Shelby

A Uniform Resource Name (URN) namespace for hardware device identifiers.

Potentially useful in applications such as in sensor data streams and storage, or equipment inventories.

Complements other similar identifiers NIs (RFC 6920), UUIDs (RFC 4122), IMEIs (RFC 7254) etc. Supports, e.g., MAC and EUI-64, identifiers.

urn:dev:mac:0024befffe804ff1

- -01 was published this week
- Fixed a typo in the ABNF ("dn:" => "org:")
- Conformance to the URN registration template

## Versions -00 and -01

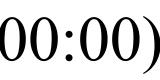

## Next Steps

- Can people read the new template (Section 3)?
- What should the draft say about q-, r-, and f-components?
- Needs text and decision: adding device IDs specified in OneM2M and LWM2M (urn:dev:os and urn:dev:ops)?
  - And would BBF USP protocol identifiers be useful to add as well?
- Adding other, new device identification schemes related to Web of Things work (e.g., urn:dev:wot:something:mysensor1)
  - Note: the DEV URN scheme allows extension to new types, do not have to define everything now
  - But getting the initial set of the relevant ones would be very useful

- 09:30–09:35 Intro, Agenda 09:35–10:00 Post-WGLC: CoCoA (CG) 10:00–10:10 dev URN (JA) 10:10–10:25 Getting ready: ERT (CA) 10:15-10:25 Getting ready: OSCORE-Group (MT) 10:25-10:40 New response codes (AK) 10:25–10:40 Pending for EST (PV) 10:40–10:50 Pubsub (MK) 10:50–11:00 Dynlink/Interfaces (BS)

# 'Pending' response code

Peter van der Stok, Klaus Hartke

130

IETF 101 - CoRE Working Group

## Motivation

## RFC 7030: Enrollment over Secure Transport (EST) uses http response 202 when result is not immediately available (say: 3 hours) in response to GET or POST.

## No such response code exists for coap. This functionality is needed for EST over coap.

The request has been accepted for processing, but the processing has not been completed. The request might or might not eventually be acted upon, as it might be disallowed when processing actually takes place. The representation sent with this response ought to describe the request's current status and point to (or embed) a status monitor that can provide the user with an estimate of when the request will be fulfilled.

## HTTP 202

draft-ietf-ace-coap-est specifies requests to servers to verify a node's identity; this may need manual intervention and takes a minimum response time

draft-ietf-core-coap-pubsub specifies a server to send a response to the client to indicate a valid request but may contain an empty payload. 133

draft-keranen-core-too-many-reqs specifies that response is available after minimum response time

## Use cases

## A new response code (e.g. 2.06) was deemed harmful for proxies. (They will return 5.01 (Not Implemented))

An extension to response code 5.03 "Service Unavailable" does not cover the case because service is available

This draft specifies a content format "60001" extension to existing response codes

20 March 2018

## History

CoRE, IETF101, London

## Details

- Pending response indicates that target resource exists, but no representation is available yet.
- Location may be specified where result will become available.
- Allows multiple clients to have multiple concurrent requests open at the server.
- Client has to retry with GET request after Max-Age. • Can be used in conjunction with "observe"

- How should application-specific state machines be added to CoAP applications?
- **REST** approach: transfer **representations**
- Need to define **media types** for those application states
- Related trial balloon: draft-bormann-core-maybe-00

Pushing application-specific state machines into CoAP?

## CoRE Pub/Sub CoRE Interfaces CoRE Dynlink

Status, Issues, and Roadmap

138

Jaime Jimenez, Ari Keranen, Michael Koster, Bill Silverajan, Julian Zhu

## CoRE Pub/Sub - Status

- Incremental progress since last WG review, document cleanup
- Split out the proposed new CoAP response codes into a separate draft
  - Too Many Requests like HTTP 429
  - TBD No Content like HTTP 204
- TBD update security considerations to incorporate **OSCORE**
- TBD need to address some issues and comments

140

- Do we require all topics to be created under the core.ps resource?
- Conditional Notification (Dynlink parameters) for CoRE pub/sub subscribers?
- How does topic discovery work with topic trees?

## CoRE Pub/sub – Remaining Issues

## CoRE Pub/sub – Roadmap

- Small amount of work left to be done Interim meeting before IETF 102 to complete the
- remaining issues
- WG Review

## CoRE Pub/Sub CoRE Interfaces CoRE Dynlink

Status, Issues, and Roadmap

143

Jaime Jimenez, Ari Keranen, Michael Koster, Bill Silverajan, Julian Zhu

## CoRF Interfaces - Status

- The draft is informational and intended as high level guidance for how to use the "if" link target attribute
- Propose to keep the original examples, not going to try to align with any specific implementation
- Will update the examples to conform to SenML
- Close<sup>4</sup> the remaining issues

### CoRE Interfaces - Roadmap

- Address the comments and issues in the draft
- WG Review
- Prepare for WGLC at IETF 102

145

# CoRE Dynlink

- This document specifies two components
  - **Dynamic Links** that define asynchronous data transfer between two resources
  - Conditional Notification parameters that are used to filter and control notification behavior
  - Conditional notification parameters may be:
    - Included in Dynamic Links as target attributes, which point to the data source to control notifications from the data source
    - Applied to a resource instance to control its notification behavior for all observe requests as a default
    - Applied to an observation instance to
  - New proposed document structure
    - Section 1: Dynamic Links
    - Section 2: Conditional Notification

- Considered many enhancements to Conditional notification attributes, propose adding only one more notification attribute
  - pmin, pmax, lt, gt, st are already defined and being used by OMA LWM2M
  - Decided not to rename "It"
  - adding the "band" attribute in order to optionally use It and gt as a band-pass notification filter, e.g. only notify when measured value is greater than gt and less than It

### CoRE Dynlink – one new feature

# CoRE Dynlink - Roadmap

- Last changes are scoped and nearly done
  - 2 sections
  - band attribute
  - security considerations for embedded client
- WG Review

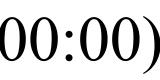

148

Prepare for WGLC at IETF 102

#### **CoAP** Protocol Negotiation

draft-silverajan-core-coap-protocol-negotiation-08

#### Bill Silverajan TUT Mert Ocak Ericsson

## Context

- Aimed at CoAP nodes that have multiple transports, and wish to allow CoAP requests and responses over some or all these transports
- Both per-server and per-resource models supported Allows clients to directly query origin servers for available transports and communicate using an alternative transport (using a CoAP Option, or a link
- attribute)
- When a CoRE Resource Directory is present, origin servers can also register transport availability to RD for clients to query (using new parameter types)

# Current Status

- Updates from -07 to -08
  - 'ol' is now a repeatable attribute allowing multiple base URIs, to align it with OCF 'ep'
  - registering alternate transports at the RD
  - 'at' is now a repeatable parameter for - Better examples provided
  - Updated example usage with RD, based on suggestions found in draft-ietf-coreresource-directory-13

# Next Steps

- Evaluate other means to obtain Option
  - Using FETCH

  - Using a resource such as "/pn/" with application/link-format

transport endpoints from the origin server in place of Alternative-Transports

- Using an entry in .well-known/ for site-wide metadata (either core or something else) resource type "core.pn" and content type

#### CoAP Communication with Alternative Transports

draft-silverajan-core-coap-alternative-transports-11

Bill Silverajan Teemu Savolainen

IETF 101 CoRE, draft-silverajan-core-coap-alternative-transports

TUT Nokia

## Context

 Draft's focus is on the URI design work for CoAP over alternative transports - If you need to embed the transport information in a CoAP URI, which URI component should be used?

#### scheme://host:port/path/to/resource?query

- as the best place to embed transport identification
- The URI query, path and authority components were all disqualified based on identified requirements Technical requirements leave only the URI scheme

# Current Status

- Draft -11 is a small delta to -10 The work has been completed - Listed as an informative reference to RFC
- - 8323
- Next step is for WG adoption

- 09:35–10:00 Post-WGLC: CoCoA (CG) 10:50–11:00 Dynlink/Interfaces (BS) 11:00–11:10 Negotiation, AT (BS) 11:10–12:00 Flextime: OPC/UA (CP), Time scale (LT), ...

## OPC UA Message Transmission Method over CoAP

draft-wang-core-opcua-transmission-03

Ping Wang, Chenggen Pu, Heng Wang, Junrui Wu, Yi Yang, Lun Shao, Jianqiang Hou

London, March 20, 2018

### Status

- Last version is 02.
- $\bullet$
- Keep the draft updated.

Made some meaningful changes according to the last meeting comments.

### What We Have Updated

Three use cases:

Offline/Online diagnostic system for resource-constrained factories, Factory data monitoring based on web pages, Factory data analysis based on cloud.

Consolidate two transmission schemes into one: Consolidate the proxy for OPC UA-CoAP and the direct transmission into one to realize better transmission performance.

### Next Steps

Contact with OPC Foundation to get feedback.

Implement the transmission schemes mentioned above over a reasonable architecture.

# Comments or Questions? Thank you!
