Hash-based Digital Signatures

- CFRG has been working on specifications for hash-based digital signatures since 2013
- draft-mcgrew-hash-sigs-10 has completed RG Last Call
  - Describes the Leighton and Micali adaptation (1995) of the original work done by Lamport, Diffie, Winternitz, and Merkle
  - Small private and public keys
  - Fast signature generation
  - Fast signature verification using a small amount of code
  - LARGE signatures
  - Moderately slow key generation
- Hash-based signatures remain secure even if the attacker has a large-scale quantum computer
• Developed in parallel to draft-mcgrew-hash-sigs
• Conventions for using these hash-based digital signatures with the CMS
• RFC 4108 uses CMS to protect firmware packages
• Small verification code size is attractive in IoT environment
• Deploy a quantum resistant signature now
• Allows deployment of the next generation of cryptographic algorithms, even if current signature algorithms are broken or a large-scale quantum computer is invented in next decade or so
Possible Ways Forward

• The relationship to CMS makes LAMPS a reasonable place to proceed
• The relationship to IoT firmware makes SUIT a reasonable place to proceed

• Thoughts?
• Recommendations to the Area Directors?
