

# RTCP Feedback for Congestion Control

draft-ietf-avtcore-cc-feedback-message-02

Zaheduzzaman Sarker – Ericsson  
**Colin Perkins** – University of Glasgow  
Varun Singh – callstats.io  
Michael A. Ramalho – Cisco

# Status

- Feedback from Sergio Mena on RMCAT list – 28 June; also comments from previous IETF
- Submitted -02 to address

# Changes in -02: Timing and Sequence Numbers

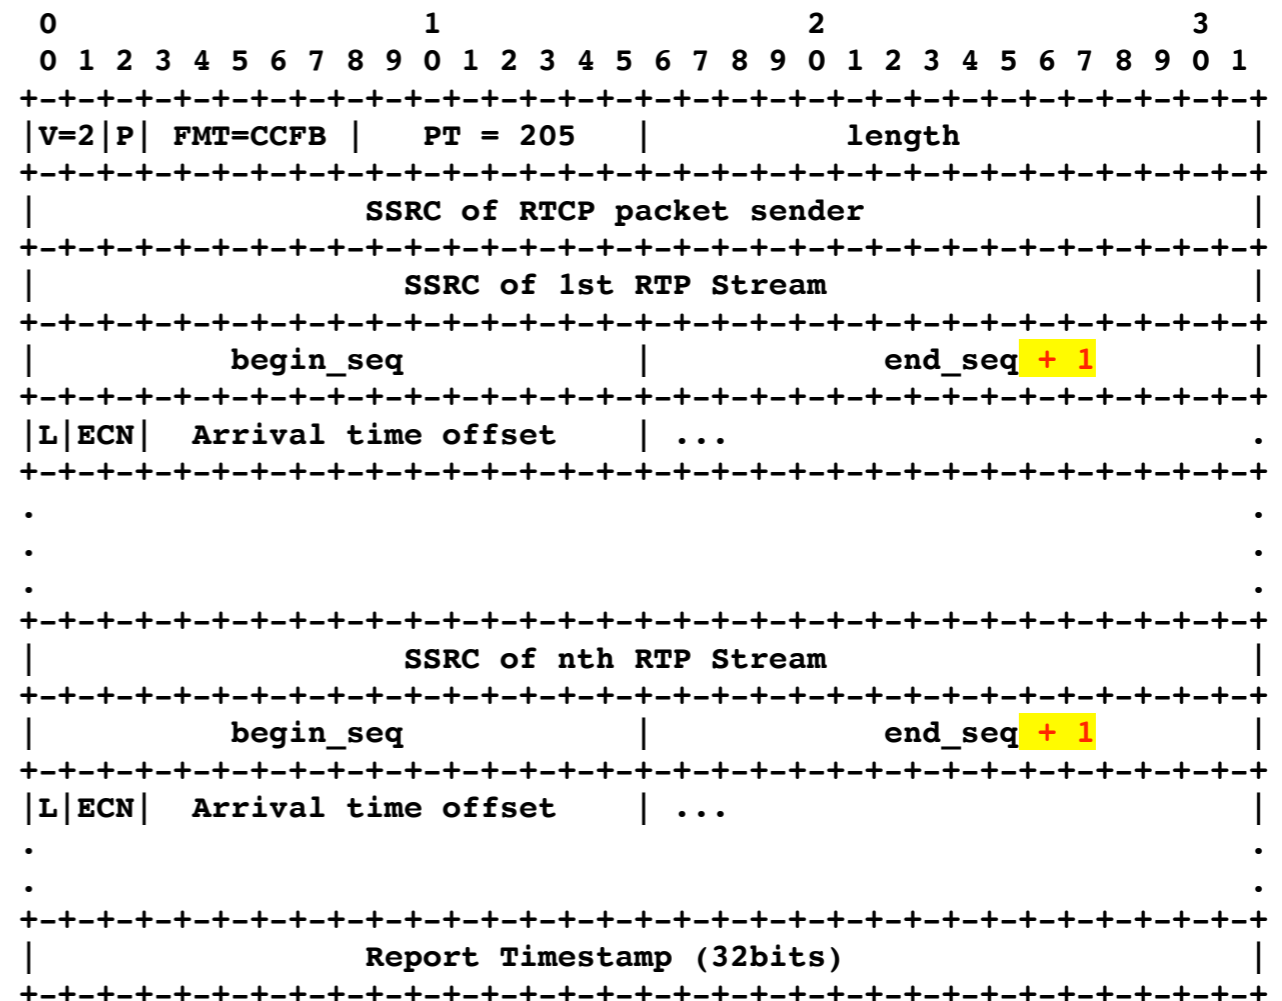

- Clarify that NTP-format report timestamp derived from same clock as that used for NTP-format timestamp in RTCP SR packets

- Reformat reports:

- $end\_seq \rightarrow end\_seq+1$
- Simplifies implementations
- Use  $begin\_seq = end\_seq+1$  to signal “no packets received”

- Open issue:

- Would  $begin\_seq$  and  $length$  be better?

# Changes in -02: Sequence Number Gaps

- Previous versions have language about not accepting reports where the RTP sequence number jumps by more than 16384 packets from the last report – crude check that report is valid
- This adds a note about resynchronisation after burst loss:

**Reports that cover RTP sequence number ranges that are more than 16384 (i.e., one quarter of the sequence number space) ahead of the last end\_seq received from an SSRC, or behind the last begin\_seq received from an SSRC, modulo 65535 to account for wrap-around, SHOULD be ignored. An exception to this occurs if sender has sent RTP packets using more than one quarter of the sequence number space since it last received an RTCP congestion control feedback packet, then a report on recently sent RTP packets ought to be accepted, to allow recovery from report packet loss.**

- Also adds a note:

**Each report block MUST NOT include more than 16384 packet metric blocks (i.e., it MUST NOT report on more than one quarter of the sequence number space in a single report).**

(for clarity – this wasn't actually possible due to MTU limitations)

# Changes in -02: Signalling

- Update IANA considerations:

**The IANA is requested to register one new RTP/AVPF Transport-Layer Feedback Message in the table for FMT values for RTPFB Payload Types [RFC4585] as defined in Section 3.1:**

**Name:** CCFB  
**Long name:** RTP Congestion Control Feedback  
**Value:** (to be assigned by IANA)  
**Reference:** (RFC number of this document, when published)

**The IANA is also requested to register one new SDP "rtcp-fb" attribute "ack" parameter, "ccfb", in the SDP ("ack" and "nack" Attribute Values) registry:**

**Value name:** ccfb  
**Long name:** Congestion Control Feedback  
**Usable with:** ack  
**Reference:** (RFC number of this document, when published)

- The latter allows signalling use of this format using the mechanism defined in RFC 4585

# Next Steps

- Please review – hope for WG last call by next meeting
