Using Pre-Shared Key (PSK) in the Cryptographic Message Syntax (CMS)
draft-housley-cms-mix-with-psk-04

Russ Housley
LAMPS WG at IETF 102
July 2018
Use PSK for Quantum Protection

- Open question whether a large-scale quantum computer is feasible, and if so, when it might happen
- If it happens, RSA and Diffie-Hellman and Elliptic Curve Diffie-Hellman become vulnerable
- The concern ...  
  - Today: Adversary saves CMS-protected content
  - Someday: Decrypt content when a large-scale quantum computer becomes available
- The solutions ...  
  - Near-term: Strong PSK as an input to the derivation of the content-encryption key
  - Long-term: Quantum-resistant public-key cryptographic algorithms (the winners of NIST competition)
Mixing with a PSK

• The draft defines two quantum-resistant ways to establish encryption keys. In both cases, a PSK MUST be distributed to the sender and all of the recipients by some out-of-band means that does not make it vulnerable to the future invention of a large-scale quantum computer, and an identifier MUST be assigned to the PSK.

• Two new OtherRecipientInfo structures:
  – KeyTransPSKRecipientInfo
  – KeyAgreePSKRecipientInfo
Overview

1. The content-encryption key is generated at random.
2. The key-derivation key is generated at random.
3. The key-encryption key is established for each recipient:
   - **key transport**: the key-derivation key is encrypted in the recipient's public key, then the key derivation function (KDF) is used to mix the pre-shared key (PSK) and the key-derivation key to produce the key-encryption key; or
   - **key agreement**: the recipient's public key and the sender's private key are used to generate a pairwise symmetric key, then the key derivation function (KDF) is used to mix the pre-shared key (PSK) and the pairwise symmetric key to produce the key-encryption key.
4. The key-encryption key is used to encrypt the content-encryption key.
