Module Tags - 02

Update since IETF 101

- Adopted a couple comments received since last IETF:
- Recommend vendors take steps to be unique (e.g., org name).
- Clarify module definitions don't require standardized tags.
 - Only **standardized** module definitions.
- Did not adopt use of extension for module specified tags
 - Tags come from many places not just in a specification.
 - The pre-defined tags are directions/suggestions for the implementer.
 - Adds extra complexity / requirements.

- Working Group Last Call?

Backup Slides

- "How installed tags found?", config vs opstate.
- "What tags are allowed" Server accepts all tags as user is final authority.
- "How tags are defined?" it's enough to identify the standards org and then let them pick. In IETF ("ietf:") we define an IANA registry and entries are "specification required".
