

# SACM Terminology

Birkholz & Montville

IETF 102

14 → 15

- Brought back some terms
- Kept the expositional text separate from the actual definition
- Tried to keep Aristotelian definitions wherever possible
  - EX: An  $X$  is a  $Y$  that  $Z$ .
- Many issues resolved/addressed/in progress
- 21 unresolved issues remain in GitHub
  - A couple of PRs have been made to address #78 and #82
  - At least one appears to be a “wontfix”

# Issue #84 (and #61?): Remove asset and asset management?

- We seem to have consensus that we should remove asset, and therefore asset management
- A proposal was made to narrow to terms hardware and software inventory

What is the sense in the room about this issue?

# Issue #80: Do we need to define timestamp?

- On the surface, the term seems already well-defined
- Suggestion to name our timestamp after 4949 data object timestamp
- Assertion: Information Model may have to prescribe some characteristics to a timestamp
- Other issues/suggestions?

What is the sense in the room about this issue?

# Issue #39 (#43): Attribute and Endpoint Characteristic

- Some confusion about attribute being an attribute-value pair
- Seems not intuitive...
- The following seems more intuitive: Attribute has-value value, where attribute has a label of “minimum password length” and value is equal to 14
- Henk has a different perspective...

What is the sense in the room about this issue?

# Questions

- Are there others willing to help with terminology?
- Is use of GitHub an issue/blocker?
