Abstract

This document contains the initial revision of the YANG module iana-dns-class-rr-type that contains derived types reflecting two IANA registries: DNS CLASSes and Resource Record (RR) TYPES. These YANG types are intended as a minimum basis for future data modeling work.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on December 29, 2019.

1. Introduction

YANG [RFC7950] has become a de facto standard as a language for
modeling configuration and state data, as well as specifying
management operations and asynchronous notifications. It is
reasonable to expect that the approach based on utilizing such data
models along with standard management protocols such as NETCONF and
RESTCONF can be effectively used in DNS operations, too. In fact,
several efforts are currently underway that attempt to use NETCONF or
RESTCONF for configuring and managing

- authoritative servers
- resolvers
- zone data.

While it is possible to use the management protocols mentioned above
with ad hoc or proprietary data models, their real potential can be
realized only if there is a (completely or partly) unified data model
supported by multiple DNS software implementations. Operators can
then, for instance, run several different DNS servers in parallel,
and use a common configuration and management interface and data for
all of them. Also, it becomes considerably easier to migrate to
another implementation.

Based on the previous experience from the IETF Routing Area, it is to
be expected that the development of unified data models for DNS will
be a lengthy and complicated process that will require active
cooperation and compromises from the vendors and developers of major
DNS server platforms. Nevertheless, it is likely that any DNS-
related data modeling effort will need to use various DNS parameters
and enumerations that are specified in several IANA registries. For
use with YANG, these parameters and enumerations have to be
translated into corresponding YANG types or other structures. Such translations should be straightforward and relatively uncontroversial.

This document is a first step in translating DNS-related IANA registries to YANG. It contains the initial revision of the YANG module "iana-dns-class-rr-type" that defines derived types for the common parameters of DNS resource records (RR): class and type. These YANG types, "dns-class" and "rr-type", reflect the IANA registries "DNS CLASSes" and "Resource Record (RR) TYPES" [IANA-DNS-PARAMETERS].

It is worth emphasizing that the role of the DNSOP Working Group is only in preparing and publishing this initial revision of the YANG module. Subsequently, whenever a new class or RR type is added to the above registries, IANA will also update the iana-dns-class-rr-type YANG module, following the instructions in Section 4 below.

2. YANG Design Considerations

The IANA document "Domain Name System (DNS) Parameters" [IANA-DNS-PARAMETERS] contains altogether thirteen registries. The YANG module iana-dns-class-rr-type defines derived types corresponding to only two of the registries that are essential for data models involving zone data, namely "DNS CLASSes" and "Resource Record (RR) TYPES". It is expected that the remaining registries in [IANA-DNS-PARAMETERS], as well as other DNS-related IANA registries, will be analogically reflected in future YANG modules as necessary. This way, an appropriate combination of YANG modules can be chosen depending on which YANG types are needed for a given data modeling purpose.

[RFC3597] introduced the option of specifying a class or type via its assigned decimal number, as an alternative to the mnemonic name. For example, the "IN" class can be equivalently written as "CLASS1", and "AAAA" type as "TYPE28".

Accordingly, the derived types "dns-class" and "rr-type" are defined in the YANG module as a union of two member types:

- 16-bit decimal integer ("uint16")
- mnemonic name, represented by the enumeration type "dns-class-name" and "rr-type-name", respectively.

As unassigned and reserved class and types values are not included in the mnemonic name enumerations, they can be used only via their decimal codes.
3. YANG Module

RFC Editor: In this section, replace all occurrences of "XXXX" with the actual RFC number and all occurrences of the revision date below with the date of RFC publication (and remove this note).

4. IANA Considerations

RFC Editor: In this section, replace all occurrences of "XXXX" with the actual RFC number (and remove this note).

This document defines the initial version of the IANA-maintained iana-dns-class-rr-type YANG module.

The iana-dns-class-rr-type YANG module is intended to reflect the "DNS CLASSes" and "Resource Record (RR) TYPES" registries in [IANA-DNS-PARAMETERS].

IANA has added this new note to the "iana-dns-class-rr-type YANG Module" registry:

Classes and types of DNS resource records must not be directly added to the iana-dns-class-rr-type YANG module. They must instead be added to the "DNS CLASSes" and "Resource Record (RR) TYPES" registries, respectively.

When a new DNS class or RR type is added to the "DNS CLASSes" or "Resource Record (RR) TYPES" registry, a new "enum" statement must be added to the "dns-class-name" or "rr-type-name" type, respectively. The assigned name defined by the "enum" statement is the same as the mnemonic name of the new class or type. The following substatements to the "enum" statement should be defined:

"value": Use the decimal value from the registry.

"status": Include only if a class or type registration has been deprecated (use the value "deprecated") or obsoleted (use the value "obsolete").

"description": Replicate the corresponding information from the registry, namely the full name of the new DNS class, or the meaning of the new RR type, if any.

"reference": Replicate the reference from the registry, if any, and add the title of the document, if applicable.

Unassigned or reserved values are not included in the "dns-class-name" and "rr-type-name" enumeration types.
Each time the iana-dns-class-rr-type YANG module is updated, a new "revision" statement must be added before the existing "revision" statements.

IANA has added this new note to the "DNS CLASSes" and "Resource Record (RR) TYPEs" registries:

When this registry is modified, the YANG module iana-dns-class-rr-type must be updated as defined in RFC XXXX.

The "Reference" text in the "DNS CLASSes" registry has been updated as follows:

OLD:

[RFC6895]

NEW:

[RFC6895][RFCXXXX]

The "Reference" text in the "Resource Record (RR) TYPEs" registry has been updated as follows:

OLD:

[RFC6895][RFC1035]

NEW:

[RFC6895][RFC1035][RFCXXXX]

4.1. URI Registrations

This document registers a URI in the "IETF XML Registry" [RFC3688]. The following registration has been made:

Registrant Contact: The IESG.
XML: N/A, the requested URI is an XML namespace.

4.2. YANG Module Registrations

This document registers a YANG module in the "YANG Module Names" registry [RFC6020]. The following registration has been made:

name:      iana-dns-class-rr-type
prefix:    dnsct
reference: RFC XXXX
5. Security Considerations

This document translates two IANA registries into YANG data types and otherwise introduces no technology or protocol. Consequently, there are no security issues to be considered for this document.

Abstract

DNS responders must either follow RFC 6891 by fully implementing EDNS or at least respond to queries containing OPT record according to older specifications. Non-compliant implementations which do not respond at all are not worth talking to.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on November 30, 2018.

This document is subject to BCP 78 and the IETF Trust’s Legal Provisions Relating to IETF Documents (https://trustee.ietf.org/license-info) in effect on the date of publication of this document. Please review these documents carefully, as they describe your rights and restrictions with respect to this document. Code Components extracted from this document must include Simplified BSD License text as described in Section 4.e of
Neither the original DNS standard RFC 1035 nor its extensions RFC 2671 and RFC 6891 allow not to respond to a DNS query. Many years later non-compliant implementations which drop queries still exist and cause a lot of extra queries, latency, and complicated logic in recursive resolvers. The cost of supporting these non-compliant implementations keeps increasing.

1.1. Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC 2119.

2. The Protocol

No DNS response message to a repeated DNS query containing EDNS extension implies that the other side is not a DNS responder. The querier MUST NOT retry its query without EDNS.

3. Security Considerations

Instruction to follow EDNS standard does not change security properties beyond what is written in RFC 6891.

4. Privacy Considerations

This has no effect on privacy of DNS.
5. IANA Considerations

[Note to IANA, to be removed prior to publication: there are no IANA considerations stated in this version of the document.]
