

MLS Architecture

IETF 103

Open issues

- What is the purpose of the architecture doc?
 - Defines the functional and security requirements for the protocol
- Deniability
 - Still one of MLS goals, however “Required Vs Optional” is still an open question
- DS trust
 - There are some scenarios where using the DS to store the public group state will be more efficient
 - Can we trust the DS to store the public group state?
 - Should this be mentioned in the doc as an optional and leave it to the app to choose based on their trust model?
