

Quantum Internet

Axel Dahlberg

Entanglement for everyone

Enabling quantum communication between local quantum processors anywhere on earth.

Why construct a quantum internet?

For Quantum Communication

- Quantum secure communications
- Secure Identification
- Clock synchronization
- Protocols for distributed systems
- Combining telescopes
- Testing Physics
- Exponential savings in communication
- Cheating online games 😊
-

For Quantum Computation

- Linking small quantum computers
- Access the quantum “mainframe”

Entanglement

"Spooky action
at a distance"

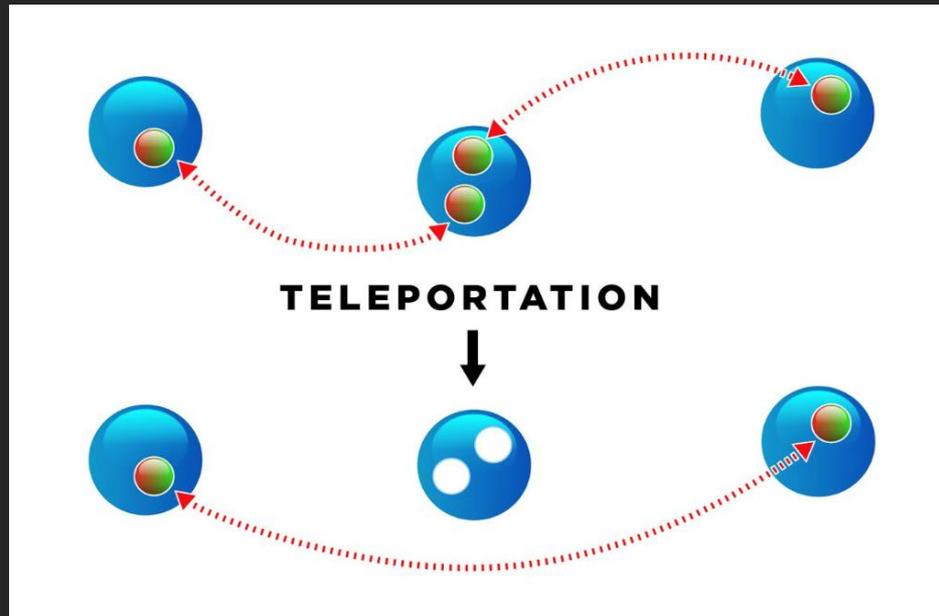

Entanglement

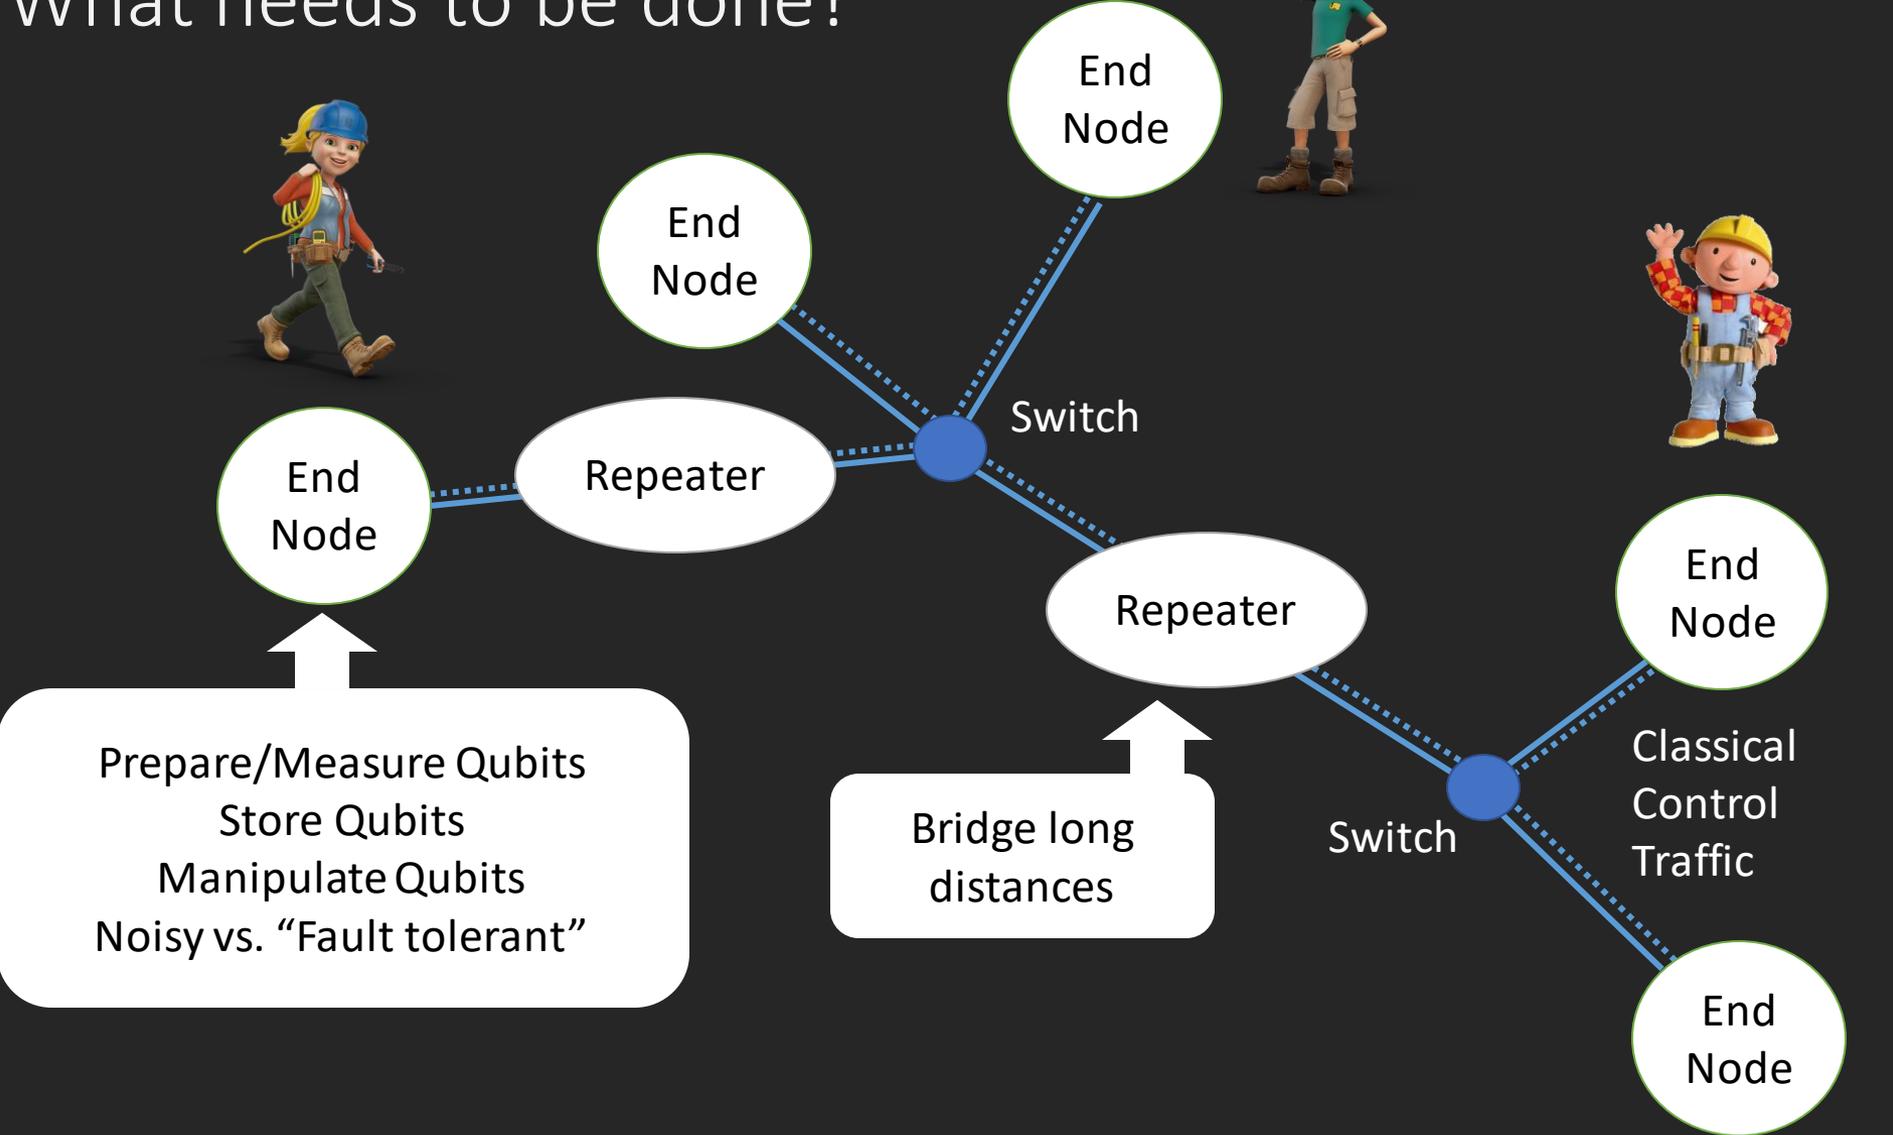

Properties of entanglement:

- Complete coordination: Measurement outcomes are random but perfectly correlated.
- Inherently private: No one can have any share of the entanglement.

Quantum repeater – bridging long distances

What needs to be done?

Prepare/Measure Qubits
Store Qubits
Manipulate Qubits
Noisy vs. "Fault tolerant"

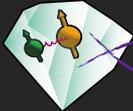

Bridge long distances

Classical Control Traffic

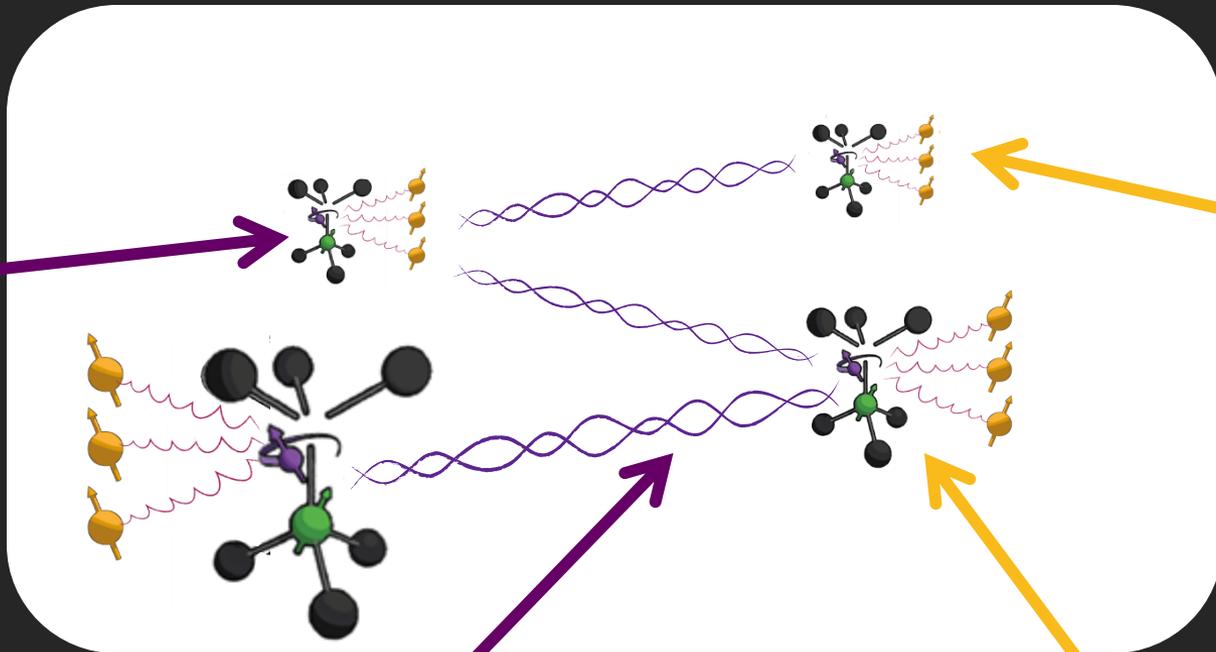

First loophole free Bell test
Nature, 526, 682-686 (2015)
Science's Top 10 Breakthroughs of 2015
Nature's Science Events that shaped 2015

End Node

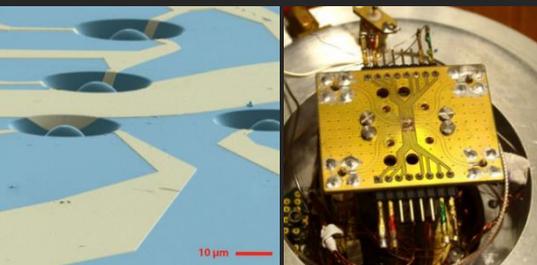

Communication qubits to generate remote entanglement (faster than 1/storage time)

Robust memory qubits for storage (also during networking activity!)

To bridge long distances: photons at telecom wavelength and/or free-space links to satellites

High-fidelity control and readout for processing and error correction

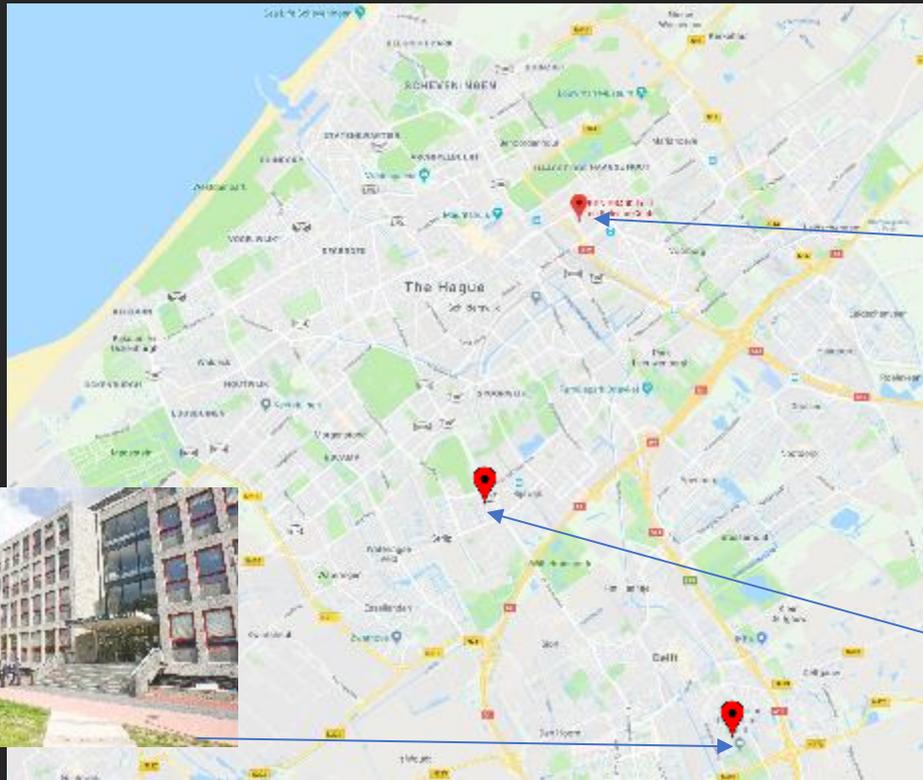

Repeater

Science 356, 928 (2017)

2019 Test link

KPN PB400: node location

KPN telephone exchange: detector location

TU Delft: node location

- Make 2 processor nodes that are prepared for future upgrades
- Direct Quantum Key Distribution link authenticating traffic
- Make use of existing telecom (dark) fibers
- Generation of entanglement between the 2 nodes
- Gain experience

2020 Demo

- Upgrade existing nodes
- 4 processor nodes
- Direct QKD links between neighbouring nodes to authenticate control traffic
- Demonstrate first quantum network stack
- Universal programmability
- Make platform available on the internet

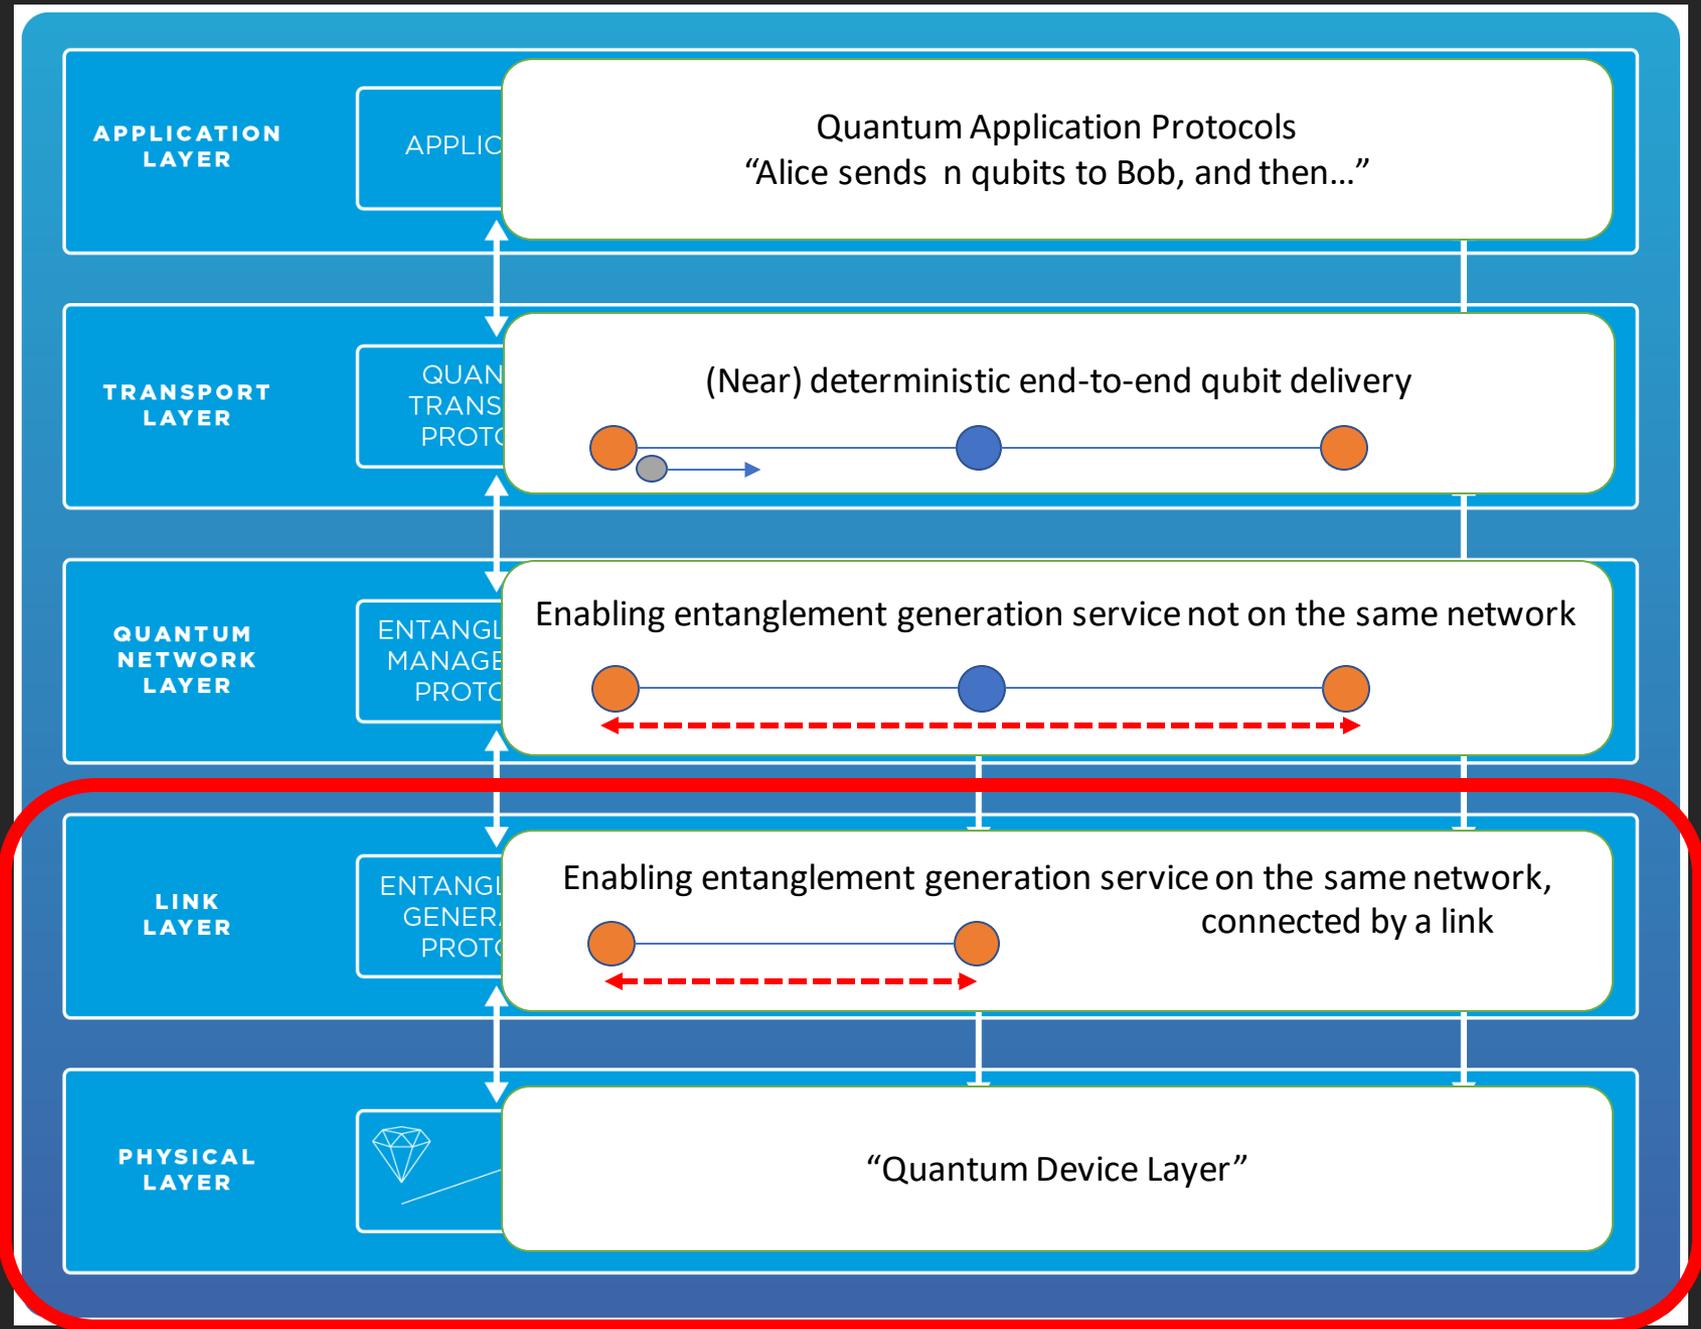

SURF

NET

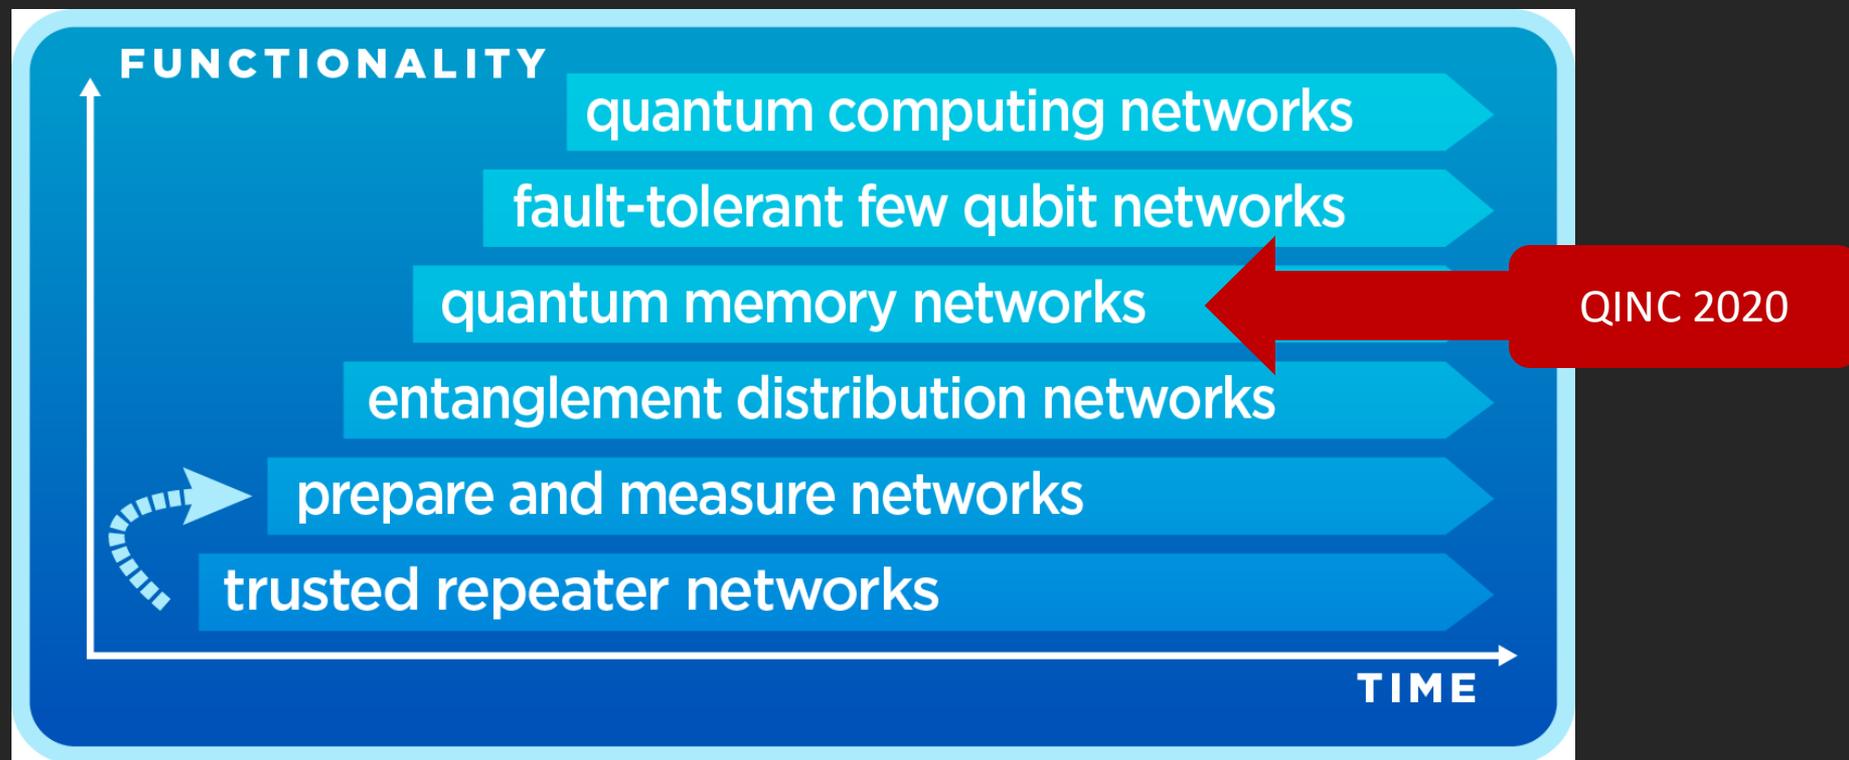

AMSTERDAM
LEIDEN
THE HAGUE
DELFT

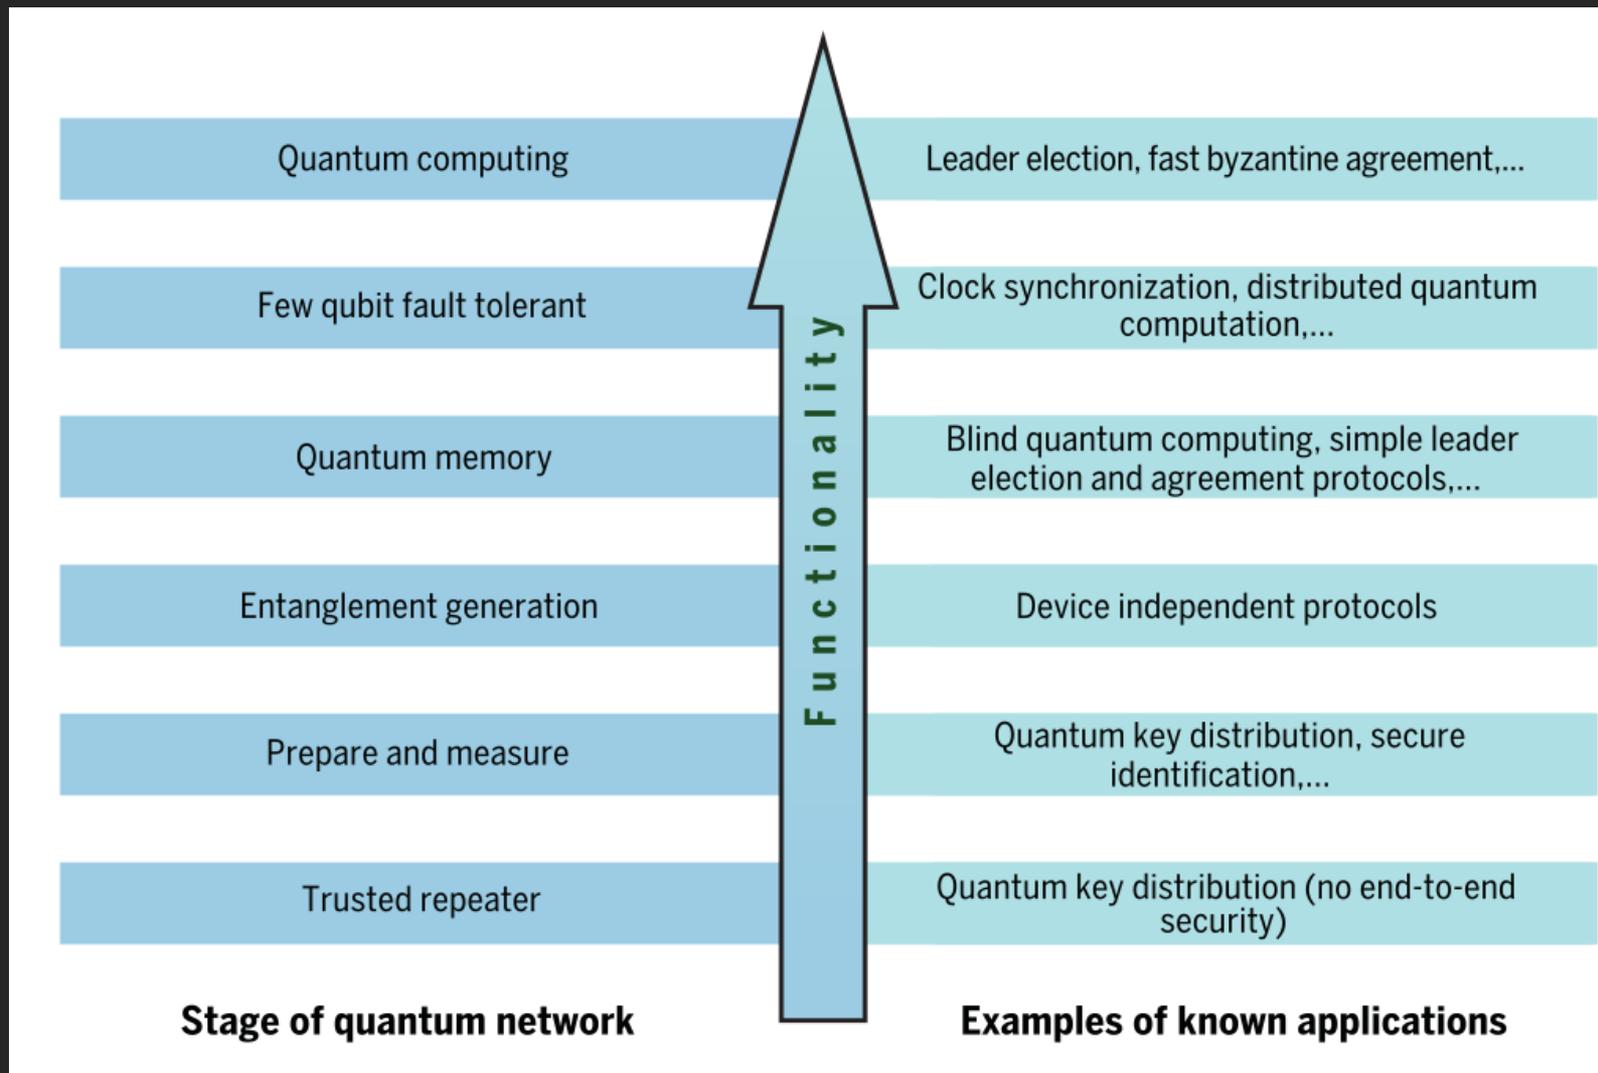

The diagram shows a map of the Netherlands with four nodes marked by red and green spheres. Dotted red arrows indicate a path connecting the nodes in a sequence: Amsterdam, Leiden, The Hague, and Delft. The map is overlaid on a blue background with a network grid pattern.
