YANG Data Models for Multiprotocol Label Switching - Transport Profile

draft-busizheng-teas-mpls-tp-yang-00.txt

Status of this Memo

This Internet-Draft is submitted to IETF in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/lid-abstracts.txt>

The list of Internet-Draft Shadow Directories can be accessed at <http://www.ietf.org/shadow.html>.

This Internet-Draft will expire on September 11, 2019.

Section 4.e of the Trust Legal Provisions and are provided without warranty as described in the Simplified BSD License.

Abstract

Multi-protocol Label Switching - Transport Profile (MPLS-TP) is a profile of the MPLS protocol that is used in packet switched transport networks and operated in a similar manner to other existing transport technologies (e.g., OTN), as described in RFC5921. This document specifies YANG models for MPLS-TP, which have not been covered by existing models so far. The gap analysis with current relevant traffic-engineering (TE) and MPLS models is also included.

1. Introduction

Multi-protocol Label Switching - Transport Profile (MPLS-TP) is a packet switching technology intended operated in a similar manner to other existing transport technologies (e.g., OTN), as described in [RFC5921], which includes Traffic Engineering (TE) features.

Generic TE models, including the TE topology and tunnel, have been defined in [TE-Topology] and [TE-Tunnel] using the YANG data modeling language and are applicable to any TE technologies including MPLS-TE and OTN and therefore also to MPLS-TP.

The YANG models for MPLS with TE features (MPLS-TE), are provided in [TE-MPLS] as a technology-specific augmentations of the generic TE models. However, technology-specific augmentations for TE label, and TE bandwidth of TE Topology and Tunnel models, have not been covered yet.

This document defines YANG data models for MPLS-TP topologies and tunnels, providing the minimum set of attributes that are required and not yet available in existing TE and MPLS YANG models. See section 3 and 4 for more detailed gap analysis.

The proposed MPLS-TP YANG models can be used as an input to enhance the current MPLS-TE YANG models.

2. Considerations on the Augmentation

2.1. Modules Relationship

In this draft two models are proposed: one MPLS-TP technology-specific topology model that augments the `ietf-te-topology` YANG module, defined in [TE-Topology], and another MPLS-TP technology-specific tunnel model that augments the `ietf-te` YANG module, defined in [TE-Tunnel].

The following common fundamental models are imported:

- o `ietf-routing-types` defined in [RFC8294]

Figure 1: Relationship of MPLS-TP topology and tunnel module with TE generic TE topology and tunnel YANG modules

2.2. Prefixes in Model Names

In this document, names of data nodes and other data model objects are prefixed using the standard prefix associated with the corresponding YANG imported modules, as shown in Table 1.

Prefix	YANG module	Reference
yang	ietf-yang-types	[RFC6991]
inet	ietf-inet-types	[RFC6991]
rt-types	ietf-routing-types	[RFC8294]
tet	ietf-te-topology	[TE-Topology]
te	ietf-te	[TE-Tunnel]
te-mpls	ietf-te-mpls	[TE-MPLS]
mpls-tp-topo	ietf- mpls-tp-topo	This document
mpls-tp-tunnel	ietf- mpls-tp-tunnel	This document

Table 1: Prefixes and corresponding YANG modules

3. Gap Analysis for MPLS-TP topology

There are no YANG models that provide MPLS-TE technology-specific augmentations of the generic TE Topology model defined in [TE-Topology].

This section analyses the minimum set of attributes that are required to be specified in an MPLS-TP technology-specific augmentation.

Additional attributes that may be required to support a broader set of MPLS-TP and/or MPLS-TE functions are for further study.

Given the guidance for augmentation in [TE-Topology], the following technology-specific augmentations need to be provided:

- A network-type to indicate that the TE topology is an MPLS-TP Topology, as follow:

```
augment /nw:networks/nw:network/nw:network-types/tet-te-topology:
  +-- rw mpls-tp-topology!
```

- TE Bandwidth Augmentations a described in section 3.1;

- TE Label Augmentations as described in section 3.2;

3.1. TE Bandwidth Augmentations

Following TE Bandwidth attributes are needed to be augmented to the module `ietf-te-topology` in [TE-Topology]:

- Augmentations for `te-bandwidth` in the `max-link-bandwidth`, `max-resv-link-bandwidth` and `unreserved-bandwidth` attributes of MPLS-TP TE Links are necessary for `te-link-attributes` and listed as follow. It is worth noting that for `te-bandwidth` in other places, this augment is not necessary.

```
augment /nw:networks/nw:network/nt:link/tet:te/tet:te-link-
attributes/tet:max-link-bandwidth/tet:te-bandwidth/tet:technology:
  +--: (mpls-tp)
    +--rw mpls-tp-bandwidth?   uint64
```

```
augment /nw:networks/nw:network/nt:link/tet:te/tet:te-link-
attributes/tet:max-resv-link-bandwidth/tet:te-
bandwidth/tet:technology:
  +--: (mpls-tp)
    +--rw mpls-tp-bandwidth?   uint64
```

```
augment /nw:networks/nw:network/nt:link/tet:te/tet:te-link-
attributes/tet:unreserved-bandwidth/tet:te-
bandwidth/tet:technology:
  +--: (mpls-tp)
    +--rw mpls-tp-bandwidth?   uint64
```

- Augmentations for the `max-lsp-bandwidth` attribute are necessary for MPLS-TP TE Links and TTPs and listed as following. It is worth noting that for the other '`max-lsp-bandwidth`', this augmentation is not necessary.

```
augment /nw:networks/nw:network/nt:link/tet:te/tet:te-link-
attributes/tet:interface-switching-capability/tet:max-lsp-
bandwidth/tet:te-bandwidth/tet:technology:
  +--: (mpls-tp)
    +--rw bandwidth-profile-name?   string
    +--rw bandwidth-profile-type?   identityref
    +--rw CIR?                      uint64
    +--rw EIR?                      uint64
    +--rw CBS?                      uint64
```

```

      +---rw EBS?                               uint64

augment /nw:networks/nw:network/nw:node/nt:termination-
point/tet:te/tet:interface-switching-capability/tet:max-lsp-
bandwidth/tet:te-bandwidth/tet:technology:
  +---:(mpls-tp)
    +---rw bandwidth-profile-name?             string
    +---rw bandwidth-profile-type?             identityref
    +---rw CIR?                                uint64
    +---rw EIR?                                uint64
    +---rw CBS?                                uint64
    +---rw EBS?                                uint64

```

3.2. TE Label Augmentations

In MPLS-TP, the label allocation is done by NE, information about label values availability is not necessary to be provided to the controller. Moreover, MPLS-TP tunnels are currently established within a single domain.

Therefore this document does not define any MPLS-TP technology-specific augmentations, of the TE Topology model, for the TE label since no TE label related attributes should be instantiated for MPLS-TP Topologies.

4. Gap Analysis for MPLS-TP Tunnel Configuration

MPLS-TE technology-specific augmentations of the generic TE Tunnel model defined in [TE-MPLS].

This section analyses the minimum set of attributes that are required to be specified in an MPLS-TP technology-specific augmentation and not yet available in [TE-MPLS].

Additional attributes that may be required to support a broader set of MPLS-TP and/or MPLS-TE functions are for further study.

Although there are no guidance for augmentation in [TE-Tunnel], the following technology-specific augmentations need to be provided:

- TE Bandwidth Augmentations as described in section 4.1
- TE Label Augmentations as described in section 4.2

4.1. TE Bandwidth Augmentation

Following TE Bandwidth attributes are needed to be augmented for MPLS-TP to the module `ietf-te` in [TE-Tunnel], but are not yet defined in [TE-MPLS]:

- Augmentations for the `te-bandwidth` attribute of TE Tunnels under `te/globals/tunnels` are listed as follow. It is worth noting that for `te-bandwidth` in other places, this augmentation is not necessary.

```
augment /te:te/te:tunnels/te:tunnel/te:te-bandwidth/te:technology:
  +--:(mpls-tp)
    +--rw bandwidth-profile-name?   string
    +--rw bandwidth-profile-type?   identityref
    +--rw CIR?                      uint64
    +--rw EIR?                      uint64
    +--rw CBS?                      uint64
    +--rw EBS?                      uint64
```

4.2. TE Label Augmentation

Following TE Label attributes are needed to be augmented for MPLS-TP to the module `ietf-te` in [TE-Tunnel], but are not yet defined in [TE-MPLS]:

- Augmentations for the `te-label` attribute of MPLS-TP label hops are used to report the computed primary and secondary paths of MPLS-TP TE Tunnels as well as the route and the path of the MPLS-TP LSPs of the primary and secondary paths of MPLS-TP TE Tunnels. These augmentations are listed as follow, and it is worth noting for `te-label` in other places, there is no need to do the augmentation.

```
augment /te:te/te:tunnels/te:tunnel/te:p2p-primary-paths/te:p2p-
primary-path/te:computed-paths-properties/te:computed-path-
properties/te:path-properties/te:path-route-objects/te:path-
computed-route-object/te:type/te:label/te:label-hop/te:te-
label/te:technology:
  +--:(mpls-tp)
    +--ro mpls-label?   rt-types:mpls-label
```

```
augment /te:te/te:tunnels/te:tunnel/te:p2p-primary-paths/te:p2p-
primary-path/te:lsps/te:lsp/te:path-properties/te:path-route-
objects/te:path-computed-route-object/te:type/te:label/te:label-
hop/te:te-label/te:technology:
```

```

    +--:(mpls-tp)
      +--ro mpls-label?    rt-types:mpls-label

augment /te:te/te:tunnels/te:tunnel/te:p2p-secondary-paths/te:p2p-
secondary-path/te:computed-paths-properties/te:computed-path-
properties/te:path-properties/te:path-route-objects/te:path-
computed-route-object/te:type/te:label/te:label-hop/te:te-
label/te:technology:
  +--:(mpls-tp)
    +--ro mpls-label?    rt-types:mpls-label

augment /te:te/te:tunnels/te:tunnel/te:p2p-secondary-paths/te:p2p-
secondary-path/te:lsps/te:lsp/te:path-properties/te:path-route-
objects/te:path-computed-route-object/te:type/te:label/te:label-
hop/te:te-label/te:technology:
  +--:(mpls-tp)
    +--ro mpls-label?    rt-types:mpls-label

```

6. Open Issues

A few open issues are listed in this section for discussion with the WG experts:

- The value for 'encoding' in ietf-te-topology and ietf-te should be configured as 'lsp-encoding-packet' for MPLS-TP;
- The value for 'switching-type' in ietf-te-topology and ietf-te should be configured as 'switching-psc1' for MPLS-TP;
- There are still open issues for [TE-Tunnel], so the right directory may need to be confirmed up to the latest module ietf-te after maturity;
- Is it possible to integrate the proposal augmentation into [TE-MPLS]?

If the answer is 'yes', the following open issues need to address in the merged document.

- Some attributes will be needed to understand whether MPLS-TP specific features (such as no ECMP, no PHP, bidirectional LSP and GAL) are supported by the MPLS-TE topology and/or required to be supported by the MPLS-TE tunnel to be setup
- Per Tunnel-Termination-Point (TTP) modeling, one TTP per physical PE node should be sufficient for MPLS-TP;
- An empty container should be set for client-layer-adaption in the topology model for MPLS-TP;

Finally, it is not clear how to generate the inter-layer-lock-id for MPLS-TP and other layers, which may be considered in future.

7. Security

TBD.

8. Acknowledgements

We thank Loa Andersson and Igor Bryskin for providing useful suggestions for this draft.
