## Quantum networks: the vision

- Quantum nodes at which information is stored and processed.
" atoms
- Quantum channels for information transport.
" photons

## Two kinds of quantum networks

## Unentangled Networks

Good only for quantum key distribution (QKD), whi h aids
longevity of secrecy encrypted inform: classical networ. Very limited distar. satellite possible!). Weak in multi-hop sett.igs, better for point-to-point. Easier (still not easy) to build.

Actually a series of steps from here to there (Wehner, Elkouss, Hanson)

## Entangled Networks

Good for many purposes:

- crypl $\supset$ functions including QKD
cision sensor networks
` quantum computers um Internet.
stance using quantum

Strong in networked settings. Hard to build.

## Entanglement（量子もつれ ）

## Even if they are far apart！

# ON THE EINSTEIN PODOLSKY ROSEN PARADOX* 

J. S. BELL ${ }^{\dagger}$<br>Department of Physics, University of Wisconsin, Madison, Wisconsin

(Received 4 November 1964)

## I. Introduction

THE paradox of Einstein, Podolsky and Rosen [1] was advanced as an argument that quantum mechanics could not be a complete theory but should be supplemented by additional variables. These additional variables were to restore to the theory causality and locality [2]. In this note that idea will be formulated mathematically and shown to be incompatible with the statistical predictions of quantum mechanics. It is the requirement of locality, or more precisely that the result of a measurement on one system be unaffected by operations on a distant system with which it has interacted in the past, that creates the essential difficulty. There have been attempts [3] to show that even without such a separability or locality requirement no "hidden variable" interpretation of quantum mechanics is possible. These attempts have been examined elsewhere [4] and found wanting. Moreover, a hidden variable interpretation of elementary quantum theory [5] has been explicitly constructed. That particular interpretation has indeed a grossly nonlocal structure. This is characteristic, according to the result to be proved here, of any such theory which reproduces exactly the quantum mechanical predictions.

## The job of a quantum repeater network is...

- ...to make end-to-end entanglement (modulo some arguments about temporal matters).
- And, entanglement is a consumable resource, so we have to make lots of it.

## So the job of a quantum repeater is...

- 1) to make base-level entanglement over a physical link
- 2) to couple entangled links along an end-to-end path to meet the applications' needs
- 3) to monitor and manage errors (purification, QEC, or both)
- 4) to participate in the management of the network

## And the job of a Quantum Internet is...

To do all of this:

- across heterogeneous networks (both physically and logically)
- in an environment with minimal trust between networks
- no knowledge of the internals of autonomous networks
- possible presence of malicious nodes

Teleportation-based Error Correction

## Good for \& not good for

Quantum networks are about new capabilities, not some path to huge communication bandwidth. Reduced \# of communication rounds (asymptotically, theoretically), higher precision, scalability of distributed quantum systems, etc.

BEL'S SECOND THEOREM:
MISUNDERSTANDINGS OF BELL'S THEOREM
HAPPEN 50 FAST THAT THEY VIOLATE LOCALITY.

No faster-than-light communication!
You can each get shared, secret random numbers upon measuring shared, entangled states, but that doesn't give you the ability to send messages.

(Submitted on 24 May 2016 (v1), last revised 9 Sep 2016 (this version, v2))

> For some abstract tasks, theoretically can be exponentially fewer rounds of communication. I don't know much about this, but see Raz STOC 1999; arXiv:quant-ph/0101005; arXiv:quant-ph/0611209; arXiv:1605.07372; and a few others.

## Technical demands

Some of these require only the ability to measure an inbound photon at the end nodes, others require ability to entangle your local memory at the fewqubit level. True distributed computing (e.g. blind) requires lots of high-fidelity memory.

FIG. 2: Timing for application classes over a single forward-propagating link.

## Basic terminology \& concepts

## Seven Key Concepts for Quantum Computing

- Superposition
- Interference
- Entanglement
- Unitary (reversible) operation
- Measurement
- No-cloning theorem
- Decoherence

## (Abbreviated) Glossary

- Quantum amplitude: represented by a complex number, the "amount" of the quantum wave function in a particular state
- Pure state: A quantum state whose preparation process did exactly what it was supposed to (no noise, no errors, no decay). n.b.: might be in superposition, might be entangled. Fidelity $=1.0$.
- Mixed state: A quantum state with noise, errors, decay. Fidelity < 1.0.
- Entangled state: A multi-qubit quantum state whose qubits can't be described independently, only in the context of all the qubits.
- Bell pair: A canonical two-qubit entangled state. There are four types, can be interconverted, and also can be used as a basis set for describing two-qubit states.

## Superposition: Quanta Behaving Like Waves

## Interference /干渉 / การทับช้อน

# Basic mathematical notation (see extensive appendix for more) 

## Dirac's Bra-ket Notation

$$
\begin{array}{r}
\text { ket } \\
{\left[\begin{array}{l}
1 \\
0
\end{array}\right] \equiv|0\rangle} \\
{\left[\begin{array}{l}
0 \\
1
\end{array}\right] \equiv|1\rangle} \\
\frac{1}{\sqrt{2}}\left[\begin{array}{l}
1 \\
1
\end{array}\right]=?
\end{array}
$$

Dirac's Bra-ket Notation

$$
\begin{aligned}
& \text { ket } \\
& {\left[\begin{array}{l}
1 \\
0
\end{array}\right] \equiv|0\rangle} \\
& {\left[\begin{array}{l}
0 \\
1
\end{array}\right] \equiv|1\rangle} \\
& \frac{1}{\sqrt{2}}\left[\begin{array}{l}
1 \\
1
\end{array}\right]=? \frac{1}{\sqrt{2}}|0\rangle+\frac{1}{\sqrt{2}}|1\rangle \\
& {\left[\begin{array}{l}
\alpha \\
\beta
\end{array}\right]=?}
\end{aligned}
$$

## Dirac's Bra-ket Notation

bra
ket

$$
\begin{array}{cc}
{\left[\begin{array}{ll}
1 & 0
\end{array}\right] \equiv\langle 0|} & {\left[\begin{array}{l}
1 \\
0
\end{array}\right] \equiv|0\rangle} \\
{\left[\begin{array}{ll}
0 & 1
\end{array}\right] \equiv\langle 1|} & {\left[\begin{array}{l}
0 \\
1
\end{array}\right] \equiv|1\rangle} \\
{\left[\frac{1}{\sqrt{2}}\right.} & \left.\frac{1}{\sqrt{2}}\right] \\
{\left[\begin{array}{ll}
\alpha & \beta
\end{array}\right]=?} & \frac{1}{\sqrt{2}}\langle 0|+\frac{1}{\sqrt{2}}\langle 1| \frac{1}{\sqrt{2}}\left[\begin{array}{l}
1 \\
1
\end{array}\right]=\frac{1}{\sqrt{2}}|0\rangle+\frac{1}{\sqrt{2}}|1\rangle \\
& {\left[\begin{array}{l}
\alpha \\
\beta
\end{array}\right]=?}
\end{array}
$$

## State Vector for Two \& Three Qubits

$$
\begin{aligned}
& \quad|\psi\rangle=\left(\begin{array}{c}
\alpha_{00} \\
\alpha_{01} \\
\alpha_{10} \\
\alpha_{11}
\end{array}\right) \\
& \\
& \leftarrow \text { amplitude of 00 } \\
& \leftarrow \text { amplitude of 01 } \\
& \leftarrow \text { amplitude of 10 } \\
& \text { amplitude of } 11 \quad|\psi\rangle=\left(\begin{array}{c}
\alpha_{000} \\
\alpha_{001} \\
\alpha_{010} \\
\alpha_{011} \\
\alpha_{100} \\
\alpha_{101} \\
\alpha_{110} \\
\alpha_{111}
\end{array}\right) \\
& \text { There are } 2^{\wedge} n \text { elements in the state vector } \\
& \text { for } n \text { qubits. }
\end{aligned}
$$

Each amplitude is a complex number.
Prob. of measuring $i$ is $\left|\alpha_{i}\right|^{2}$
Normalization requires $\sum_{i=0}^{2^{n}-1}\left|\alpha_{i}\right|^{2}=1$

# - No-cloning theorem 

 of a quantum state cannot be made.- This theorem is important for cryptographic communication with quantum computation. try to copy $|\psi\rangle$ and $|\phi\rangle$ to $|s\rangle$ :
$U$ is virtual gate which copy the input first qubit to the second

$$
\begin{array}{r}
U(|\psi\rangle \otimes|s\rangle)=|\psi\rangle \otimes|\psi\rangle \\
U(|\phi\rangle \otimes|s\rangle)=|\phi\rangle \otimes|\phi\rangle \\
(\langle s| \otimes\langle\phi|) U^{-1} U(|\psi\rangle \otimes|s\rangle)=(\langle\phi| \otimes\langle\phi|) \otimes(|\psi\rangle \otimes|\psi\rangle) \\
\langle\phi \mid \psi\rangle=\langle\phi \mid \psi\rangle^{2} \\
\langle\phi \mid \psi\rangle=0,1
\end{array}
$$

Then, $|\psi\rangle$ is same or orthogonal.

# Basics of entanglement: Bell pairs \& nonlocality 

## Nonlocality - the arguments

Either quantum mechanics is nonlocal, or it is incomplete (secret plans)

## Einstein

## Even if it is incomplete, it is still nonlocal!

## Aspect

No local hidden variable theory can explain my experiment.

## The EPR argument

Einstein, Podolsky, and Rosen asked: is quantum mechanics complete? Before we measure a system, does it have a definite state?
" If , without in any way disturbing a system, we can predict with certainty (i.e., with probability equal to unity) the value of a physical quantity, then there exists an element of physical reality corresponding to this physical quantity."

## The EPR argument

Preconditions of the argument:

1. Locality: no immediate signaling.
2. Each measurement generates a single result.

QM is either nonlocal OR incomplete.

Bell's arguments
Bell wondered if adding in hidden variables really saves QM from being nonlocal.

Bell derived an inequality that any local hidden variable theory must satisfy.

He then showed that there are some quantum states that can violate this inequality.

So quantum mechanics cannot be described with a local hidden variables theory.

That's all well and good in theory, but...
Experimentally, Bell inequality violations have been measured convincingly in many settings.

Since 2015: In three experiments, in ways that close all loopholes that (most) people take seriously...

Note: There are many Bell-type inequalities. Most famous: Clauser-Horne-Shimony-Holt (CHSH).

## The Bell states

$$
\begin{array}{ll}
\left|\Phi^{+}\right\rangle=\frac{\left|0_{A} 0_{B}\right\rangle+\left|1_{A} 1_{B}\right\rangle}{\sqrt{2}} & \left|\Psi^{+}\right\rangle=\frac{|01\rangle+|10\rangle}{\sqrt{2}} \\
\left|\Phi^{-}\right\rangle=\frac{|00\rangle-|11\rangle}{\sqrt{2}} & \left|\Psi^{-}\right\rangle=\frac{|01\rangle-|10\rangle}{\sqrt{2}}
\end{array}
$$

Bell states are entangled states. That is, they can't be written as separable states ("product states").
(These four can also be used as a basis set to rewrite any two-qubit state.)

Bell states are a resource for quantum communication and computation.

Bell pairs can be used to generate secret keys.
If two people share a Bell pair, one can send a quantum state to the other.

The no-signaling theorem

Can we use quantum nonlocality to send a signal faster than light?

NO - it is a mathematical consequence of quantum mechanics that even if it is nonlocal, quantum systems cannot signal each other.

## Consequences for quantum computing

INFORMATION CANNOT TRAVEL FASTER THAN THE SPEED OF LIGHT
(probably)
Entangled states can appear to be signaling each other, but really they cannot.

Always look for the classical communication channel...

$$
|\psi\rangle=\alpha|0\rangle+\beta|1\rangle
$$

Alice
Bob

## Implementation

## How can I make my own Bell pair?

Need: two-level quantum systems in which to encode information.

Wish list:

- easy to entangle with each other
- easy to measure (in different bases)
- both of those processes: fast \& accurate
- minimal information loss (through interaction with the environment)
- transportable
- identical

## Spoiler alert: there's no perfect TLS.

...so the best choice depends on the application.

## Some favorites:

- photons
- we have: lasers, optical fibers, wave plates \& detectors...
- how do you get just one? what if you want it to stay in one place?
- atoms
- controlled interactions with lasers \& microwaves; storage \& processing
- require sophisticated laboratories; not going anywhere
- artificial atoms
- properties can be tailored; scalable fabrication
- are they really identical? are there only two levels?
- also not going anywhere...

## Quantum networks: the vision

- Quantum nodes at which information is stored and processed.
" atoms
- Quantum channels for information transport.
" photons

## Photons

## encode 0 and 1 in...

- polarization
- time bin
- number
- path

D

## Atoms

identify two electronic states!

- how long do they live?
- are they addressable with lasers? microwaves?
- are they sensitive to environmental fluctuations?

## Generating remote entanglement, probabilistically

- Each atom emits a photon (or not).
- The atom's state depends on whether or not it emitted a photon (a), or the photon polarization (b).
- The detectors can't tell which atom the photon(s) came from.
- Detection projects the atoms into an entangled state.

Remotely entangled qubit $\triangle$ Flying qubit (photons)
Qubit in an encoded block $\triangle$ Measurement $(\mathrm{X} / \mathrm{Z})$ CNOT gate
Teleportation-based Error Correction

## Five Repeater Schemes

- 1G: Purify and swap over ACKed links: truly a distributed computation (Dur \& Briegel, Lukin, others; since 1998)
- 2G: Error Correction over ACKed links
- CSS quantum error correction \& entanglement swapping (Jiang (Lukin) et al., 2009)
- Surface code quantum error correction, sort of but not quite swap (Fowler et al., 2010)
- 3G: Error Correction over no-ACK-needed links: store-and-forward
- Quasi-asynchronous (Munro et al., 2010)
- Memoryless
(Munro et al., 2012)

## Quantum Repeater Operation

Bell State
Measurement
Called entanglement swapping.
Fidelity declines; you must purify afterwards

## Nested Entanglement Swapping

## Station 0 Station $1 \quad$ Station $2 \quad$ Station 3 Station 4

 level 0 - 000000000080000000000010

Dur \& Briegel, many others

## Purification: Error Detection

one used as a test tool to test an assertion about the other.
The test tool is destroyed in the process.
On success, confidence in the tested state (fidelity) improves. On failure, tested state is discarded.

## Repeater Protocol Stack

## Application <br> Purification Control (PC) $\}$ <br> Entang. Swapping Ctl (ESC) <br> Purification Control (PC) $\}$ Repeated at Different Distances

Entanglement Control (EC)
Physical Entanglement (PE)
Distance=1 Only quantum!

Van Meter et al., IEEE/ACM Trans. on Networking, Jun. 2009, quant-ph:0705.4128

## Four-Hop Protocol Interactions

## 2G \& 3G are still far away

- Even 1G is really hard
- Entanglement success probability is low, many round trips in protocols, few qubits per node, memory lifetimes are still problematic
- Getting \& keeping a Bell pair to the left at the same time as Bell pair to the right to enable swapping
- Getting \& keeping two Bell pairs for purification
- Gate errors in both purification and swapping
- 2G: Error Correction over ACKed links
- Will blow up resource requirements at least 7x, before the probabilistic problems above
- Gate error rates too high for QEC to work yet
- 3G: Error Correction over no-ACK-needed links (store-and-forward)
- Prob. 80-93\% or better (depending on code) of correctly receiving each individual photon

## What would the simplest 1 G repeater look like?

## H.-J. Briegel, W. Dür, J. I. Cirac, and P. Zoller, Phys. Rev. Lett. 81, 5932 (1998)

1. Entangle one pair of atoms.
2. Entangle a second pair of atoms.
3. A Bell measurement on the two central atoms entangles the two outermost atoms.

This approach is not scalable because errors accumulate.

entangled!

## What would the simplest 1 G repeater look like?

## H.-J. Briegel, W. Dür, J. I. Cirac, and P. Zoller, Phys. Rev. Lett. 81, 5932 (1998)

Entanglement purification is the key to scalability.
Multiple copies of entangled pairs are reduced to fewer copies with higher fidelity. Requirements: gate operations between local qubits \& readout of one qubit.

Quantum repeater = entanglement swapping + purification
Note that we have to wait for classical information to travel from A to B.

entangled!

## No one has built a quantum repeater yet.

## The simplest version:

1. Eight qubits, three nodes
2. Gate operations between qubits for Bell-state measurements and purification.
Closest experiment: entanglement purification with four qubits (two NV centers, two nuclear spins).
N. Kalb et al., Science 356, 928 (2017)

## State of research

## Some networking results from rdv's group

Quantum internet: A Vision for the road ahead (https://doi.org/10.1126/science.aam9288):
This was presented already in Bangkok. This paper defines stages of quantum networks and what applications can be realized on these.

A Link Layer Protocol for Quantum Networks (will be on arXiv tomorrow!):
Presents a link layer protocol which provides the defines service in
https://datatracker.ietf.org/doc/draft-dahlberg-II-quantum/ together with simulations of performance metrics of a complete implementation of the protocol using a discrete-event simulator.

Parameter regimes for a single sequential quantum repeater (https://arxiv.org/abs/1705.00043):
Assesses the performance of single sequential quantum repeaters using realistic hardware parameters.
Fully device-independent conference key agreement (https://arxiv.org/abs/1708.00798):
Presents security proof for fully device-independent conference key, which task is to distribute a secret key among N parties.

Anonymous transmission in a noisy quantum network using the W state (https://arxiv.org/abs/1806.10973): Shows how one can perform anonymous transmission using a $W$ state, which in many regimes can tolerate more noise than the more common approach of using a GHZ state.

SimulaQron - A simulator for developing quantum internet software (https://arxiv.org/abs/1712.08032):
Presenting SimulaQron, a simulator intended to be used for development of software for quantum networks.

# Final thoughts: <br> References, learning more \& getting involved

# Workshop for Quantum Repeaters and Networks 

## n．b．：Dates still tentative

## Join us in Japan，Sept．5－6， 2019

Beginning with dinner on the 4th，ending at breakfast on the 7th． More details coming soon．
Note that dates are still tentative．

## Appendices

- Vectors, Matrices, Dirac's bra-ket notation, and Complex Numbers
- Quantum States
- Single-Qubit Gates
- Two-Qubit Gates
- Density Matrix
- Teleportation by the numbers

Vectors, Matrices,
Dirac's bra-ket notation, and some complex numbers

## Vectors

A vector has a direction and a distance. It can be described via a set of coordinates, assuming the vector starts at the origin.

## Dirac's Bra-ket Notation

$$
\begin{array}{r}
\text { ket } \\
{\left[\begin{array}{l}
1 \\
0
\end{array}\right] \equiv|0\rangle} \\
{\left[\begin{array}{l}
0 \\
1
\end{array}\right] \equiv|1\rangle} \\
\frac{1}{\sqrt{2}}\left[\begin{array}{l}
1 \\
1
\end{array}\right]=?
\end{array}
$$

Dirac's Bra-ket Notation

$$
\begin{aligned}
& \text { ket } \\
& {\left[\begin{array}{l}
1 \\
0
\end{array}\right] \equiv|0\rangle} \\
& {\left[\begin{array}{l}
0 \\
1
\end{array}\right] \equiv|1\rangle} \\
& \frac{1}{\sqrt{2}}\left[\begin{array}{l}
1 \\
1
\end{array}\right]=? \frac{1}{\sqrt{2}}|0\rangle+\frac{1}{\sqrt{2}}|1\rangle \\
& {\left[\begin{array}{l}
\alpha \\
\beta
\end{array}\right]=?}
\end{aligned}
$$

## Dirac's Bra-ket Notation

bra
ket

$$
\begin{array}{cc}

\alpha \\
\beta
\end{array}\right]=?}
\end{array}
$$

## Vector Addition

$$
\begin{array}{ll}
|\psi\rangle=\left[\begin{array}{l}
\alpha \\
\beta
\end{array}\right] & |\psi\rangle+|\phi\rangle=\left[\begin{array}{l}
\alpha+\gamma \\
\beta+\delta
\end{array}\right] \\
|\phi\rangle=\left[\begin{array}{l}
\gamma \\
\delta
\end{array}\right] &
\end{array}
$$

## Vector Inner Product

$$
\begin{array}{ll}
|\psi\rangle=\left[\begin{array}{l}
\alpha \\
\beta
\end{array}\right] & \langle\phi \mid \psi\rangle=\alpha \gamma+\beta \delta \\
\langle\phi|=\left[\begin{array}{ll}
\gamma & \delta
\end{array}\right] &
\end{array}
$$

## Matrix

$$
\begin{aligned}
A= & {\left[\begin{array}{llll}
a_{0,0} & a_{0,1} & a_{0,2} & a_{0,3} \\
a_{1,0} & a_{1,1} & a_{1,2} & a_{1,3} \\
a_{2,0} & a_{2,1} & a_{2,2} & a_{2,3} \\
a_{3,0} & a_{3,1} & a_{3,2} & a_{3,3}
\end{array}\right] \quad \begin{array}{c}
\text { n.b.: It's more } \\
\text { standard to start } \\
\text { index at 1, but 0 will } \\
\text { be more convenient }
\end{array} } \\
& {\left[\begin{array}{llll}
b_{0,0} & b_{0,1} & b_{0,2} & b_{0,3}
\end{array} \quad \begin{array}{c}
\text { here. }
\end{array}\right.}
\end{aligned}
$$

## Matrix Addition

$$
A+B=\left[\begin{array}{llll}
a_{0,0}+b_{0,0} & a_{0,1}+b_{0,1} & a_{0,2}+b_{0,2} & a_{0,3}+b_{0,3} \\
a_{1,0}+b_{1,0} & a_{1,1}+b_{1,1} & a_{1,2}+b_{1,2} & a_{1,3}+b_{1,3} \\
a_{2,0}+b_{2,0} & a_{2,1}+b_{2,1} & a_{2,2}+b_{2,2} & a_{2,3}+b_{2,3} \\
a_{3,0}+b_{3,0} & a_{3,1}+b_{3,1} & a_{3,2}+b_{3,2} & a_{3,3}+b_{3,3}
\end{array}\right]
$$

Multiplying a vector by a matrix

$$
\begin{aligned}
A|\psi\rangle & =\left[\begin{array}{ll}
a_{0,0} & a_{0,1} \\
a_{1,0} & a_{1,1}
\end{array}\right]\left[\begin{array}{l}
\alpha \\
\beta
\end{array}\right] \\
& =\left[\begin{array}{l}
a_{0,0} \alpha+a_{0,1} \beta \\
a_{1,0} \alpha+a_{1,1} \beta
\end{array}\right]
\end{aligned}
$$

## Complex numbers

Quantum physics contains complex numbers so that
Quantum information is consist of complex numbers.

$$
i=\sqrt{-1}
$$

## Complex plane <br> Im

$a+b i=r(\cos \theta+i \sin \theta)$

$$
=r \frac{e^{i \theta}}{\backslash}
$$

Euler's formula

## Complex Numbers in Bra-ket

Earlier presentation wasn't quite complete!

$$
\begin{aligned}
|\psi\rangle & =\left[\begin{array}{c}
\alpha \\
\beta
\end{array}\right] \quad\langle\psi \mid \psi\rangle=\alpha \alpha^{*}+\beta \beta^{*} \\
\langle\psi| & =\left[\begin{array}{ll}
\alpha^{*} & \beta^{*}
\end{array}\right] \quad=a^{2}+b^{2}+c^{2}+d^{2} \\
\alpha & =a+i b \\
\alpha^{*} & =a-i b \text { complex conjugate } \\
\beta & =c+i d \\
\beta^{*} & =c-i d
\end{aligned}
$$

## Vector Outer Product

# $|\psi\rangle\langle\phi|=$ $\left[\begin{array}{ll}\alpha \gamma^{*} & \alpha \delta^{*} \\ \beta \gamma^{*} & \beta \delta^{*}\end{array}\right]$ 

Same thing as tensor!
...what's a tensor?

## Tensor Product

$$
\begin{gathered}
A=\left(\begin{array}{ll}
a_{0,0} & a_{0,1} \\
a_{1,0} & a_{1,1}
\end{array}\right) \quad B=\left(\begin{array}{ll}
b_{0,0} & b_{0,1} \\
b_{1,0} & b_{1,1}
\end{array}\right) \\
A \otimes B
\end{gathered} \begin{array}{r}
=\binom{a_{0,0}\left(\begin{array}{ll}
b_{0,0} & b_{0,1} \\
b_{1,0} & b_{1,1} \\
a_{0,0} & b_{0,1} \\
b_{1,0} & b_{1,1}
\end{array}\right)}{a_{0,1}\left(\begin{array}{ll}
b_{0,0} & b_{0,1} \\
b_{1,0} & b_{1,1} \\
a_{0,0} & b_{0,1} \\
b_{1,0} & b_{1,1}
\end{array}\right)}
\end{array}
$$

## Tensor Product

$$
\begin{array}{rr}
H=\frac{1}{\sqrt{2}}\left[\begin{array}{rr}
1 & 1 \\
1 & -1
\end{array}\right] & I \otimes H=\frac{1}{\sqrt{2}}\left[\begin{array}{rrrr}
1 & 1 & 0 & 0 \\
1 & -1 & 0 & 0 \\
0 & 0 & 1 & 1 \\
0 & 0 & 1 & -1
\end{array}\right] \\
I=\left[\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right] & H \otimes I=\frac{1}{\sqrt{2}}\left[\begin{array}{rrrr}
1 & 0 & 1 & 0 \\
0 & 1 & 0 & 1 \\
1 & 0 & -1 & 0 \\
0 & 1 & 0 & -1
\end{array}\right]
\end{array}
$$

$$
H \otimes H=?
$$

## Quantum States

## Writing quantum states

To write a quantum state we use a ket vector:

$$
|A\rangle
$$

This is "the state of system A".
We can put many things inside kets...

## Writing quantum states

To write a quantum state we use a ket vector:

We can put many things inside kets...

## Writing quantum states

To write a quantum state we use a ket vector:

$$
|\psi\rangle
$$

We can put many things inside kets...

## Writing quantum states

To write a quantum state we use a ket vector:

$$
|\uparrow\rangle
$$

We can put many things inside kets...

## Writing quantum states

To write a quantum state we use a ket vector:

We can put many things inside kets...

## Writing quantum states

Ket vectors tell us the probability of measuring the state.

Suppose we just have two outcomes: 0 and 1.
A ket vector for the system could be written

$$
|0\rangle=\frac{1}{\sqrt{2}}|0\rangle+\frac{1}{\sqrt{2}}|1\rangle=\binom{\frac{1}{\sqrt{2}}}{\frac{1}{\sqrt{2}}}
$$

What does this mean?

## Bloch Sphere

Question: Where are

$$
\begin{array}{ll}
\frac{|0\rangle+|1\rangle}{\sqrt{2}} & \frac{|0\rangle-|1\rangle}{\sqrt{2}} \\
\frac{|0\rangle+i|1\rangle}{\sqrt{2}} & \frac{|0\rangle-i|1\rangle}{\sqrt{2}}
\end{array}
$$

Note: This is not (usually) directly relatable to something
 physical!

Bloch Sphere

Phase

Phase, then, is position about the vertical axis on the Bloch sphere.
You can't touch it, see it, smell it, taste it, or hear it.
It doesn't "mean" anything.
...but you can calculate using it.

The Z Gate

$$
Z=\left(\begin{array}{cc}
1 & 0 \\
0 & -1
\end{array}\right)
$$

Question: What does this do to this state?

$$
|\psi\rangle=\alpha|0\rangle+\beta|1\rangle
$$

Question: What does this do to any observation or measurement we make?

## Multiple Qubits: Hilbert Space is a Very Big Place

$n$ qubits can be in $2^{n}$ possible states: 000..00, 000..01, 000..10, ..., 111...10, 111.. 11

In fact, it can be in a superposition of all of those states at once:

$$
|\psi\rangle=\sum_{i=0}^{2^{n}} \alpha_{i}|i\rangle
$$

## State Vector for Two \& Three Qubits

$$
\begin{aligned}
&|\psi\rangle=\left(\begin{array}{c}
\alpha_{00} \\
\alpha_{01} \\
\alpha_{10} \\
\alpha_{11}
\end{array}\right) \leftarrow \text { amplitude of 00 } \\
& \leftarrow \text { amplitude of 01 } \\
& \leftarrow \text { amplitude of 10 } \\
& \leftarrow \text { amplitude of 11 }
\end{aligned} \quad\left(\begin{array}{c}
\alpha_{000} \\
\alpha_{001} \\
\alpha_{010} \\
\alpha_{011} \\
\alpha_{100} \\
\alpha_{101} \\
\alpha_{110} \\
\alpha_{111}
\end{array}\right)
$$

## Hilbert Space

Each element of the state vector is a basis vector. The total set is Hilbert space, and it grows
n.b.: Each individual qubit has two
 states, or two basis vectors, but they are multiplicative when combined -adding a qubit adds dimensions to the total size of our space!

## Bell States: Our First Important Multi-Qubit States

$$
\begin{array}{ll}
\left|\Phi^{+}\right\rangle=\frac{\left|0_{A} 0_{B}\right\rangle+\left|1_{A} 1_{B}\right\rangle}{\sqrt{2}} & \left|\Psi^{+}\right\rangle=\frac{|01\rangle+|10\rangle}{\sqrt{2}} \\
\left|\Phi^{-}\right\rangle=\frac{|00\rangle-|11\rangle}{\sqrt{2}} & \left|\Psi^{-}\right\rangle=\frac{|01\rangle-|10\rangle}{\sqrt{2}}
\end{array}
$$

Critical for quantum communication
Foundation for tests of entanglement (CHSH inequality, a little later)

## Quantum gates

- All quantum gates are unitary.
- What's unitary?
- said simply, reversible rotationton Hilbert space

## Simple single-qubit gates

## X gate, Z gate

- X gate
- rotation around X axis

$$
X=\left(\begin{array}{ll}
0 & 1 \\
1 & 0
\end{array}\right)
$$

- Z gate
- rotation around Z axis

$$
Z=\left(\begin{array}{cc}
1 & 0 \\
0 & -1
\end{array}\right)
$$

## Y gate

## - rotation around Y axis

$$
Y=\left(\begin{array}{cc}
0 & -i \\
i & 0
\end{array}\right)
$$

$$
i \times X \times Z=?
$$

## Global phase

- Global phase does not affect quantum state.

$$
\begin{aligned}
& |\phi\rangle=e^{i \theta}(a|0\rangle+b|1\rangle)
\end{aligned}
$$

> it does not change the distance from the origin)

## Y gate

$$
Y=\left(\begin{array}{cc}
0 & -i \\
i & 0
\end{array}\right)
$$

## - rotation around Y axis

$$
i \times X \times Z=?
$$

## Y gate

$$
Y=\left(\begin{array}{cc}
0 & -i \\
i & 0
\end{array}\right)
$$

## - rotation around Y axis

## Y gate

- rotation around Y axis $\quad Y=\left(\begin{array}{cc}0 & -i \\ i & 0\end{array}\right)$
- can be created by multiplying $X$ and $Z$

$$
\begin{aligned}
i \times X \times Z & =i \times\left(\begin{array}{cc}
0 & 1 \\
1 & 0
\end{array}\right) \times\left(\begin{array}{cc}
1 & 0 \\
0 & -1
\end{array}\right) \\
= & i \times\left(\begin{array}{cc}
0 & -1 \\
1 & 0
\end{array}\right)=\left(\begin{array}{cc}
0 & -i \\
i & 0
\end{array}\right)
\end{aligned}
$$

## Pauli gates

- X, Y, Z are called the Pauli matrices (Pauli gates), which are the most basic gates.

## I gate

## I gate

- Identity gate, which does not change quantum state

$$
I=\left(\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right)
$$

## H gate

- H gate exchanges the relationship between X axis and Z axis

$$
H=\frac{1}{\sqrt{2}}\left(\begin{array}{cc}
1 & 1 \\
1 & -1
\end{array}\right)
$$

$$
\begin{aligned}
H \times|0\rangle & =? \\
H \times|1\rangle & =? \\
H \times \frac{|0\rangle+|1\rangle}{\sqrt{2}} & =? \\
H \times \frac{|0\rangle-|1\rangle}{\sqrt{2}} & =?
\end{aligned}
$$

## H gate

- H gate exchanges the relationship between X axis and Z axis

$$
H=\frac{1}{\sqrt{2}}\left(\begin{array}{cc}
1 & 1 \\
1 & -1
\end{array}\right)
$$

$$
\begin{aligned}
& H \times|0\rangle=\frac{1}{\sqrt{2}}\left(\begin{array}{cc}
1 & 1 \\
1 & -1
\end{array}\right)\binom{1}{0}=\frac{1}{\sqrt{2}}\binom{1}{1}=\frac{|0\rangle+|1\rangle}{\sqrt{2}} \\
& H \times|1\rangle=\frac{1}{\sqrt{2}}\left(\begin{array}{cc}
1 & 1 \\
1 & -1
\end{array}\right)\binom{0}{1}=\frac{1}{\sqrt{2}}\binom{1}{-1}=\frac{|0\rangle-|1\rangle}{\sqrt{2}} \\
& H \times \frac{|0\rangle+|1\rangle}{\sqrt{2}}=\frac{1}{2}\left(\begin{array}{cc}
1 & 1 \\
1 & -1
\end{array}\right)\binom{1}{1}=\binom{1}{0}=|0\rangle \\
& H \times \frac{|0\rangle-|1\rangle}{\sqrt{2}}=\frac{1}{2}\left(\begin{array}{cc}
1 & 1 \\
1 & -1
\end{array}\right)\binom{1}{-1}=\binom{0}{1}=|1\rangle
\end{aligned}
$$

# Simple two-qubits gates 

## Controlled NOT

## (CNOT)

- In fact, it is more correct to call controlled X
- If the first qubit is 1 , the second qubit gets X
- the first qubit is control qubit
- the second is target qubit
$C N O T=\left(\begin{array}{cccc}0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 \\ 0 & 0 & 1 & 0\end{array}\right)$

## Controlled NOT (CNOT)

- two qubit state

$$
\begin{gathered}
\begin{array}{c}
|00\rangle \\
|01\rangle \\
|10\rangle \\
|11\rangle
\end{array} \\
C N O T \times\left(\begin{array}{l}
a \\
b \\
c \\
d
\end{array}\right) \\
\left(\begin{array}{l}
a \\
b \\
c \\
d
\end{array}\right)=\left(\begin{array}{llll}
1 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 \\
0 & 0 & 0 & 1 \\
0 & 0 & 1 & 0
\end{array}\right) \times\left(\begin{array}{l}
a \\
b \\
c \\
d
\end{array}\right)=\left(\begin{array}{l}
a \\
b \\
d \\
c
\end{array}\right)
\end{gathered}
$$

## Circuit notation

## qubits

## CNOT gate between q0 and q1

$X$ gate on q0
q 0 is control quit qi is target quit measurement of q 0 , in Z axis

SWAP gate between qi and q2

# Density Matrix Representation 

Pure vs. mixed states

## B

When $A$ is part of a larger superposition, we need to know the state of both A and B to fully know the state of $A$.

If we do not have access to the state of $B$, then we have lost information about $A$.

Pure vs. mixed states

## B

If we do not have access to the state of $B$, then we have lost information about $A$.

If we have full information about $A$ then we say " A is in a pure state".
If we do not have full information about $A$ then "A is in a mixed state".
Note: we can have full information about a superposition! $|+\rangle$ is still a "pure state".

Pure vs. mixed states

Pure states (full information) are written as state vectors, $|\Psi\rangle$.

How do we write mixed states, where we have lost some of the state information?

Representing mixed states

## density matrix!

Representing mixed states

Density matrices let us deal with uncertainty in the quantum state.

This uncertainty comes about because the state we want is part of a larger superposition, which we do not have access to.

Density matrices record the probability of measurement outcomes.

## Representing mixed states

$$
\begin{aligned}
& \text { Look again at the state } \\
& |A B\rangle=\frac{1}{\sqrt{2}}\left(|0\rangle_{A} \otimes|1\rangle_{B}+|1\rangle_{A} \otimes|0\rangle_{B}\right)
\end{aligned}
$$

We can write the state of $A$ using the density matrix $\rho_{A}$ :

$$
\rho_{A}=\frac{1}{2}\left(\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right)
$$

Representing mixed states

$$
\begin{aligned}
& |A B\rangle=\frac{1}{\sqrt{2}}\left(|0\rangle_{A} \otimes|1\rangle_{B}+|1\rangle_{A} \otimes|0\rangle_{B}\right) \\
& \rho_{A}=\frac{1}{2}(1) \frac{0}{0} 1 \\
& \begin{array}{l}
\text { Probability of } \\
\text { measuring " } 0 \text { " }
\end{array} \quad \begin{array}{l}
\text { Probability of } \\
\text { measuring " } 1 \text { " }
\end{array}
\end{aligned}
$$

So diagonal elements always add up to 1.

Representing mixed states

$$
\rho_{A}=\frac{1}{2}\left(\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right)
$$

We find the probabilities of other measurements by changing the basis.

Let's find the probability of measuring " + " or "-" given this density matrix for the state.

Representing mixed states

$$
\rho_{A}=\frac{1}{2}\left(\begin{array}{cc}
1 & 0 \\
0 & 1
\end{array}\right) \quad|+\rangle=\frac{1}{\sqrt{2}}(|0\rangle+|1\rangle)
$$

Let's find the probability of measuring " + " or "-" given this density matrix for the state.

Representing mixed states

$$
\begin{aligned}
& \rho_{A}= \frac{1}{2}\left(\begin{array}{cc}
1 & 0 \\
0 & 1
\end{array}\right) \quad H=\frac{1}{\sqrt{2}}\left(\begin{array}{cc}
1 & 1 \\
1 & -1
\end{array}\right) \\
& \rho_{A}^{\text {Hadamard }}=H \rho_{A} H
\end{aligned}
$$

Representing mixed states

$$
\begin{aligned}
\rho_{A}=\frac{1}{2}\left(\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right) & H=\frac{1}{\sqrt{2}}\left(\begin{array}{cc}
1 & 1 \\
1 & -1
\end{array}\right) \\
\rho_{A}^{\text {Hadamard }}= & H \rho_{A} H \\
= & \frac{1}{2}\left(\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right)
\end{aligned}
$$

So $\operatorname{prob}(0)=\operatorname{prob}(1)=\operatorname{prob}(+)=\operatorname{prob}(-)=0.5$

Representing mixed states

We have seen:
The density matrix gives probabilities of measuring the basis states.

We calculate the probabilities for different measurements by transforming into the basis of that measurement.

Now: how do we calculate a density matrix?

## Calculating density matrices

Now: how do we calculate a density matrix?
The elements in a density matrix represent "projection operators":

$$
\rho=\left(\begin{array}{ll}
|0\rangle\langle 0| & |1\rangle\langle 0| \\
|0\rangle\langle 1| & |1\rangle\langle 1|
\end{array}\right)
$$

So

$$
\rho_{A}=\frac{1}{2}\left(\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right)=\frac{1}{2}|0\rangle\langle 0|+\frac{1}{2}|1\rangle\langle 1|
$$

## Calculating density matrices

$$
\left.\rho_{A}=\frac{1}{2}(0\rangle\langle 0|\right)+\frac{1}{2}|1\rangle\langle 1|
$$

$$
|0\rangle\langle 0|=\binom{1}{0}(1,0)=\left(\begin{array}{ll}
1 & 0 \\
0 & 0
\end{array}\right)
$$

## Calculating density matrices

$$
\begin{gathered}
\rho_{A}=\frac{1}{2}|0\rangle\langle 0|+\frac{1}{2}|1\rangle\langle 1| \\
|0\rangle\langle 0|=\binom{1}{0}(1,0)=\left(\begin{array}{ll}
1 & 0 \\
0 & 0
\end{array}\right) \\
|1\rangle\langle 1|=\binom{0}{1}(0,1)=\left(\begin{array}{ll}
0 & 0 \\
0 & 1
\end{array}\right)
\end{gathered}
$$

## Calculating density matrices

$$
\begin{gathered}
\rho_{A}=\frac{1}{2}|0\rangle\langle 0|+\frac{1}{2}|1\rangle\langle 1| \\
|0\rangle\langle 0|=\binom{1}{0}(1,0)=\left(\begin{array}{ll}
1 & \mathbf{0} \\
0 & \mathbf{0}
\end{array}\right) \\
|1\rangle\langle 1|=\binom{0}{1}(0,1)=\left(\begin{array}{ll}
\mathbf{0} & \mathbf{0} \\
\mathbf{0} & 1
\end{array}\right)
\end{gathered}
$$

Pure vs mixed states again

$$
|0\rangle\langle 0|=\left(\begin{array}{ll}
1 & 0 \\
0 & 0
\end{array}\right) \quad|1\rangle\langle 1|=\left(\begin{array}{ll}
0 & 0 \\
0 & 1
\end{array}\right)
$$

A pure state is represented as a density matrix by a single projection operator in some basis,

$$
\rho=|\Psi\rangle\langle\Psi|
$$

A mixed surete is represented as a density matrix by a sum of projection operators:

Mixed:

$$
\rho=\sum_{i}\left|\psi_{i}\right\rangle\left\langle\psi_{i}\right|
$$

## Calculating density matrices

$$
|0\rangle\langle 0|=\left(\begin{array}{ll}
1 & 0 \\
0 & 0
\end{array}\right) \quad|1\rangle\langle 1|=\left(\begin{array}{cc}
0 & 0 \\
0 & 1
\end{array}\right)
$$

Pure:

$$
\rho=|\Psi\rangle\langle\Psi| \quad \text { Mixed: } \quad \rho=\sum_{i}\left|\psi_{i}\right\rangle\left\langle\psi_{i}\right|
$$

Let's look at the state

$$
|\Psi\rangle=\frac{1}{\sqrt{2}}(|0\rangle+|1\rangle)
$$

## Calculating density matrices

$$
|0\rangle\langle 0|=\left(\begin{array}{ll}
1 & 0 \\
0 & 0
\end{array}\right) \quad|1\rangle\langle 1|=\left(\begin{array}{ll}
0 & 0 \\
0 & 1
\end{array}\right)
$$

Pure:

$$
\rho=|\Psi\rangle\langle\Psi| \quad \text { Mixed: } \quad \rho=\sum_{i}\left|\psi_{i}\right\rangle\left\langle\psi_{i}\right|
$$

$$
\begin{gathered}
|\Psi\rangle=\frac{1}{\sqrt{2}}(|0\rangle+|1\rangle) \\
\rho=\frac{1}{2}\left(\begin{array}{ll}
1 & 1 \\
1 & 1
\end{array}\right)
\end{gathered}
$$

## Calculating density matrices

Let's look at the state $\quad|\Psi\rangle=\frac{1}{\sqrt{2}}(|0\rangle+|1\rangle)$
$\left.\qquad \rho=\frac{1}{2}(1) \frac{1}{1}\right)$

Probability of measuring " 0 "

Probability of
measuring " 1 "
Diagonal elements are probabilities, and must sum to one!

Off-diagonal elements are called "quantum coherences"

## Calculating density matrices

So is this the same thing? Still 50/50...

$$
\rho_{A}=\frac{1}{2}\left(\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right)
$$

$$
\begin{array}{r}
|\Psi\rangle=\frac{1}{\sqrt{2}}(|0\rangle+|1\rangle) \\
\rho=\frac{1}{2}\left(\begin{array}{ll}
1 & 1 \\
1 & 1
\end{array}\right)
\end{array}
$$

This is just a classical random variable, not a superposition!

Representing mixed states

$$
\begin{gathered}
\rho_{A}=\frac{1}{2}\left(\begin{array}{ll}
1 & 1 \\
1 & 1
\end{array}\right) \quad H=\frac{1}{\sqrt{2}}\left(\begin{array}{cc}
1 & 1 \\
1 & -1
\end{array}\right) \\
\rho_{A}^{\text {Hadamard }}=H \rho_{A} H \\
=\frac{1}{2}\left(\begin{array}{ll}
1 & 0 \\
0 & 0
\end{array}\right)=|0\rangle\langle 0|
\end{gathered}
$$

50/50 superposition state taken back to 0 !

Representing mixed states

$$
\begin{aligned}
\rho_{A}=\frac{1}{2}\left(\begin{array}{cc}
1 & 0 \\
0 & 1
\end{array}\right) & H=\frac{1}{\sqrt{2}}\left(\begin{array}{cc}
1 & 1 \\
1 & -1
\end{array}\right) \\
\rho_{A}^{\text {Hadamard }}= & H \rho_{A} H \\
= & \frac{1}{2}\left(\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right)
\end{aligned}
$$

So $\operatorname{prob}(0)=\operatorname{prob}(1)=\operatorname{prob}(+)=\operatorname{prob}(-)=0.5$ !

## Summary so far

A system in a mixed state is represented by a density matrix rather than a state vector.

A pure state $|\Psi\rangle$ has a density matrix $|\Psi\rangle\langle\Psi|$ A mixed state is a sum of pure-state density matrices, $\rho=\sum_{i}\left|\psi_{i}\right\rangle\left\langle\psi_{i}\right|$
Still to answer: if we have a many-qubit pure state, how can we calculate the density matrices of the individual mixed qubit states?

## For example:

## Experimental Results

$$
\frac{|D H\rangle+e^{i \pi / 4}\left|D^{\prime} V\right\rangle}{\sqrt{2}}
$$

$D$ and $D^{\prime}$ are states of the ion, and H and V are horizontal and vertical polarization of the photon

Theal |adr

$$
F=0.974 \pm 0.02
$$

Imeginary par:

## Teleportation by the numbers

## Teleportation By the Numbers (or Symbols)

$$
\begin{aligned}
& |\psi\rangle_{D}=\alpha|0\rangle_{D}+\beta|1\rangle_{D} \quad\left|\Phi^{+}\right\rangle_{A B}=\frac{|0\rangle_{A}|0\rangle_{B}+|1\rangle_{A}|1\rangle_{B}}{\sqrt{2}} \\
& |\psi\rangle_{D}\left|\Phi^{+}\right\rangle_{A B}=\left(\alpha|0\rangle_{D}+\beta|1\rangle_{D}\right) \otimes \frac{|0\rangle_{A}|0\rangle_{B}+|1\rangle_{A}|1\rangle_{B}}{\sqrt{2}} \\
& =\frac{1}{2}\left|\Phi^{+}\right\rangle_{D A}|\psi\rangle_{B} \quad \text { Rewrite (just } \\
& +\frac{1}{2}\left|\Phi^{-}\right\rangle_{D A} Z|\psi\rangle_{B} \quad \text { algebra!) treating } \\
& \text { DA as a pair } \\
& +\frac{1}{2}\left|\Psi^{+}\right\rangle_{D A} X|\psi\rangle_{B} \\
& +\frac{1}{2}\left|\Psi^{-}\right\rangle_{D A} Z X|\psi\rangle_{B} \\
& \text { and } B \text { as a solo } \\
& \text { qubit }
\end{aligned}
$$

## Teleportation By the Numbers (or Symbols)

$$
|\psi\rangle_{D}\left|\Phi^{+}\right\rangle_{A B}=\left(\alpha|0\rangle_{D}+\beta|1\rangle_{D}\right) \otimes \frac{|0\rangle_{A}|0\rangle_{B}+|1\rangle_{A}|1\rangle_{B}}{\sqrt{2}}
$$

BSM collapses state to one of

these terms, and tells us which

Question: How do we fix it up?
