# Using HTTP/2 as a Transport for Arbitrary Bytestreams

Eric Kinnear (ekinnear@apple.com) Tommy Pauly (tpauly@apple.com)

TSVWG IETF 104, March 2019, Prague

Generic transport for secure, arbitrary bytestreams

Multiplexed streams

Low setup cost for new streams

Single congestion and recovery context

Peer-to-peer communication

Example: Remote IPC

Share underlying transport with existing infrastructure

## Why HTTP/2?

- HTTP/2 provides framing layer with many desired transport features
  - Configuration exchange
  - Multiplexed streams
  - Shared congestion control and loss recovery state
  - Flow control
  - Stream relationships and priorities
  - Traverses the internet
- Some of these properties from TLS/TCP

З

### **Potential Solution**

- CONNECT allows tunneling to another endpoint
- Extended CONNECT allows connecting to server itself
- Can also enable proxying of UDP, with additional framing
- HTTP headers enable additional negotiation
- Coexists with standard HTTP request/response streams

## New :protocol Values

- Extended CONNECT defines : protocol value for use with WebSocket
- Make generic by defining common base not specific to WebSocket
- Define additional :protocol values
  - "bytestream"
    - Direct stream mapping for arbitrary bytestreams to remote server
  - "datagram"
    - Framing for UDP transport, to server and possibly with traditional CONNECT to another endpoint

- Generic transport for secure, arbitrary bytestreams
- Multiplexed streams
  - Low setup cost for new streams
  - Single congestion and recovery context
- Peer-to-peer communication
  - Example: Remote IPC
- Share underlying transport with existing infrastructure

- Generic transport for secure, arbitrary bytestreams
- Multiplexed streams
  - Low setup cost for new streams
  - Single congestion and recovery context
- Peer-to-peer communication
  - Example: Remote IPC, QUIC
- Share underlying transport with existing infrastructure

## Why QUIC Transport?

- HTTP/3 over QUIC Transport falls back to HTTP/2 over TLS/TCP
- What transport abstraction does QUIC Transport alone use over TCP?
- HTTP/2 provides framing layer with many desired transport features Configuration exchange Multiplexed streams Flow Control Stream relationships and priorities
- TLS/TCP provides shared congestion control and loss recovery state

### Solution

- Extended CONNECT defines : protocol value for use with WebSocket
- Define additional : protocol values
  - "bytestream"
  - "datagram"
    - CONNECT to another endpoint

### Direct stream mapping for arbitrary bytestreams to remote server

### Framing for UDP transport, to server and possibly with traditional

### Define new SETTING to allow bidirectional use of (Extended) CONNECT

Add new : protocol values to Extended CONNECT handshake Built in security with low setup cost for new streams Enables the benefits above for peer-to-peer communications

- Sharing multiple connections to server over single underlying transport
- Ability to proxy UDP traffic more effectively to (and through) the server
- Add new SETTING to allow using Extended CONNECT in both directions

  - Provides fallback mechanism for QUIC Transport over HTTP/2 framing

### **Transport Properties**

- Sharing underlying transport brings benefits, but also has caveats
  - Head-of-Line blocking
  - Connection limits on flow control
  - Additional items?
- Other work on multiplexed transports (SCTP)
  - How much to reference or include?

### Questions?
