JMAP for Calendars
draft-ietf-jmap-calendars-00

Abstract

This document specifies a data model for synchronising calendar data with a server using JMAP.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on October 31, 2019.

Copyright Notice

Copyright (c) 2019 IETF Trust and the persons identified as the document authors. All rights reserved.

This document is subject to BCP 78 and the IETF Trust’s Legal Provisions Relating to IETF Documents (https://trustee.ietf.org/license-info) in effect on the date of publication of this document. Please review these documents carefully, as they describe your rights and restrictions with respect to this document. Code Components extracted from this document must include Simplified BSD License text as described in Section 4.e of the Trust Legal Provisions and are provided without warranty as described in the Simplified BSD License.
1. Introduction

JMAP ([I-D.ietf-jmap-core] - JSON Meta Application Protocol) is a
genetic protocol for synchronising data, such as mail, calendars or
contacts, between a client and a server. It is optimised for mobile
and web environments, and aims to provide a consistent interface to
different data types.

This specification defines a data model for synchronising calendar
data between a client and a server using JMAP.

1.1. Notational conventions

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT",
"SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and
"OPTIONAL" in this document are to be interpreted as described in BCP
14 [RFC2119] [RFC8174] when, and only when, they appear in all
capitals, as shown here.

Type signatures, examples and property descriptions in this document
follow the conventions established in section 1.1 of
[I-D.ietf-jmap-core].
Object properties may also have a set of attributes defined along with the type signature. These have the following meanings:

- **server-set**: Only the server can set the value for this property. The client MUST NOT send this property when creating a new object of this type.

- **immutable**: The value MUST NOT change after the object is created.

- **default**: (This is followed by a JSON value). The value that will be used for this property if it is omitted in an argument, or when creating a new object of this type.

Data types defined in the core specification are used in this document.

1.2. The Date datatypes

Where "LocalDate" is given as a type, it means a string in the same format as "Date", but with the _time-offset_ omitted from the end. The interpretation in absolute time depends upon the time zone for the event, which may not be a fixed offset (for example when daylight saving time occurs). For example, "2014-10-30T14:12:00".

1.3. Terminology

The same terminology is used in this document as in the core JMAP specification.

1.4. Addition to the capabilities object

The capabilities object is returned as part of the standard JMAP Session object; see the JMAP spec. Servers supporting _this_ specification MUST add a property called "urn:ietf:params:jmap:calendars" to the capabilities object.

The value of this property is an empty object in both the JMAP session _capabilities_ property and an account’s _accountCapabilities_ property.

2. Calendars

A Calendar is a named collection of events. All events are associated with one, and only one, calendar.

A *Calendar* object has the following properties:
o  *id*: "Id" (immutable; server-set) The id of the calendar.

o  *name*: "String" The user-visible name of the calendar. This may be any UTF-8 string of at least 1 character in length and maximum 255 octets in size.

o  *color*: "String" Any valid CSS color value. The color to be used when displaying events associated with the calendar. The color SHOULD have sufficient contrast to be used as text on a white background.

o  *sortOrder*: "UnsignedInt" (default: 0) Defines the sort order of calendars when presented in the client’s UI, so it is consistent between devices. The number MUST be an integer in the range 0 <= sortOrder < 2^31. A calendar with a lower order should be displayed before a calendar with a higher order in any list of calendars in the client’s UI. Calendars with equal order should be sorted in alphabetical order by name. The sorting should take into locale-specific character order convention.

o  *isVisible*: "Boolean" (default: true) Should the calendar’s events be displayed to the user at the moment?

o  *mayReadFreeBusy*: "Boolean" (server-set) The user may read the free-busy information for this calendar. In JMAP terms, this means the user may use this calendar as part of a filter in a CalendarEvent/query_call, however unless "mayRead == true", the events returned for this calendar will only contain free-busy information, and be stripped of any other data. This property MUST be "true" if _mayRead_ is "true".

o  *mayReadItems*: "Boolean" (server-set) The user may fetch the events in this calendar. In JMAP terms, this means the user may use this calendar as part of a filter in a CalendarEvent/query_call

o  *mayAddItems*: "Boolean" (server-set) The user may add events to this calendar. In JMAP terms, this means the user may call CalendarEvent/set_to create new events in this calendar or move existing events into this calendar from another calendar. This property MUST be "false" if the account to which this calendar belongs has the _isReadOnly_ property set to "true".

o  *mayModifyItems*: "Boolean" (server-set) The user may edit events in this calendar by calling CalendarEvent/set_with the _update_argument referencing events in this collection. This property MUST be "false" if the account to which this calendar belongs has the _isReadOnly_ property set to "true".
*mayRemoveItems*: "Boolean" (server-set) The user may remove events from this calendar by calling _CalendarEvent/set_ with the _destroy_ argument referencing events in this collection, or by updating their _calendarId_ property to a different calendar. This property MUST be "false" if the account to which this calendar belongs has the _isReadOnly_ property set to "true".

*mayRename*: "Boolean" (server-set) The user may rename the calendar. This property MUST be "false" if the account to which this calendar belongs has the _isReadOnly_ property set to "true".

*mayDelete*: "Boolean" (server-set) The user may delete the calendar itself. This property MUST be "false" if the account to which this calendar belongs has the _isReadOnly_ property set to "true".

2.1. Calendar/get

Standard "/get" method as described in [I-D.ietf-jmap-core] section 5.1. The _ids_ argument may be "null" to fetch all at once.

2.2. Calendar/changes

Standard "/changes" method as described in [I-D.ietf-jmap-core] section 5.2.

2.3. Calendar/set

Standard "/set" method as described in [I-D.ietf-jmap-core] section 5.3.

A calendar MAY be deleted that is currently associated with one or more events. In this case, the events belonging to this calendar MUST also be deleted. Conceptually, this MUST happen prior to the calendar itself being deleted, and MUST generate a *push* event that modifies the state of the _CalendarEvent_ type for the account.

3. Calendar events

A *CalendarEvent* object contains information about an event, or recurring series of events, that takes place at a particular time. It is a JSEvent object, as defined in [I-D.ietf-calext-jscalendar], with the following additional properties:

*id*: "Id" The id of the event. This property is immutable.

calendarId*: "Id" The id of the calendar this event belongs to.
3.1. CalendarEvent/get

Standard "/get" method as described in [I-D.ietf-jmap-core] section 5.1.

3.2. CalendarEvent/changes

Standard "/changes" method as described in [I-D.ietf-jmap-core] section 5.2.

3.3. CalendarEvent/set

Standard "/set" method as described in [I-D.ietf-jmap-core] section 5.3.

When an event is created, updated or destroyed, the server MUST also ensure the following:

- Any alerts are scheduled/cancelled correctly.

- If there is a _participantId_, and the corresponding participant has a _role_ of "owner":
  - If an event is created/updated: send a REQUEST iMIP email with the event as an ICS attachment to all participants that are not "you".
  - When an event is destroyed, if it is in the future, then email all participants other than you the appropriate iMIP email to inform them that the event has been cancelled. If it is in the past, the server SHOULD NOT send a message.

- If there is a _participantId_, and the corresponding participant does not have a _role_ of "owner", and the _scheduleStatus_ is updated for this participant, send the appropriate iMIP email to the _replyTo_ address.

3.4. CalendarEvent/copy

Standard "/copy" method as described in [I-D.ietf-jmap-core] section 5.4.
3.5. CalendarEvent/query

Standard "/query" method as described in [I-D.ietf-jmap-core] section 5.5.

3.5.1. Filtering

A *FilterCondition* object has the following properties:

- *inCalendars*: "Id[]|null" A list of calendar ids. An event must be in ANY of these calendars to match the condition.
- *after*: "UTCDate|null" The end of the event, or any recurrence of the event, in UTC time must be after this date to match the condition.
- *before*: "UTCDate|null" The start of the event, or any recurrence of the event, in UTC time must be before this date to match the condition.
- *text*: "String|null" Looks for the text in the _title_, _description_, _locations_ (matching name/description), or _participants_ (matching name/email) properties of the event or any recurrence of the event.
- *title*: "String|null" Looks for the text in the _title_ property of the event, or the overridden _title_ property of a recurrence.
- *description*: "String|null" Looks for the text in the _description_ property of the event, or the overridden _description_ property of a recurrence.
- *location*: "String|null" Looks for the text in the _locations_ property of the event (matching name/description of a location), or the overridden _locations_ property of a recurrence.
- *owner*: "String|null" Looks for the text in the name or email fields of a participant in the _participants_ property of the event, or the overridden _participants_ property of a recurrence, where the participant has a role of "owner".
- *attendee*: "String|null" Looks for the text in the name or email fields of a participant in the _participants_ property of the event, or the overridden _participants_ property of a recurrence, where the participant has a role of "attendee".

If zero properties are specified on the FilterCondition, the condition MUST always evaluate to "true". If multiple properties are
specified, ALL must apply for the condition to be "true" (it is equivalent to splitting the object into one-property conditions and making them all the child of an AND filter operator).

The exact semantics for matching "String" fields is *deliberately not defined* to allow for flexibility in indexing implementation, subject to the following:

- Text SHOULD be matched in a case-insensitive manner.
- Text contained in either (but matched) single or double quotes SHOULD be treated as a "phrase search", that is a match is required for that exact sequence of words, excluding the surrounding quotation marks. Use "\"", "\\" and "\"" to match a literal ",", "’" and """ respectively in a phrase.
- Outside of a phrase, white-space SHOULD be treated as dividing separate tokens that may be searched for separately in the event, but MUST all be present for the event to match the filter.
- Tokens MAY be matched on a whole-word basis using stemming (so for example a text search for "bus" would match "buses" but not "business").

3.5.2. Sorting

The following properties MUST be supported for sorting:

- start
- uid

3.6. CalendarEvent/queryChanges

Standard "/queryChanges" method as described in [I-D.ietf-jmap-core] section 5.6.

4. Security considerations

All security considerations of JMAP ([I-D.ietf-jmap-core]) apply to this specification. Additional considerations specific to the data types and functionality introduced by this document are described in the following subsections.

TODO
5. IANA considerations

5.1. JMAP capability registration for "calendars"

IANA will register the "calendars" JMAP Capability as follows:

Capability Name: "urn:ietf:params:jmap:calendars"

Specification document: this document

Intended use: common

Change Controller: IETF

Security and privacy considerations: this document, section TODO

This document is subject to BCP 78 and the IETF Trust’s Legal Provisions Relating to IETF Documents (https://trustee.ietf.org/license-info) in effect on the date of publication of this document. Please review these documents carefully, as they describe your rights and restrictions with respect to this document. Code Components extracted from this document must include Simplified BSD License text as described in Section 4.e of the Trust Legal Provisions and are provided without warranty as described in the Simplified BSD License.
1. Introduction

JMAP ([I-D.ietf-jmap-core] - JSON Meta Application Protocol) is a
generic protocol for synchronising data, such as mail, calendars or
contacts, between a client and a server. It is optimised for mobile
and web environments, and aims to provide a consistent interface to
different data types.

MDN are defined in [RFC8098] and are used as "read receipts",
"acknowledgements", or "receipt notifications".

A client can have to deal with MDN in different ways:

1. When receiving an email, an MDN can be sent to the sender. This
   specification defines an EmailSubmission/sendMDN method to cover
   this case.

2. When sending an email, an MDN can be requested. This must be
done with the help of a header, and is already specified by
[RFC8098] and can already be handled by [I-D.ietf-jmap-mail] this
way.

3. When receiving an MDN, the MDN could be related to an existing
sent mail. This is already covered by [I-D.ietf-jmap-mail] in
the EmailSubmission object. Client could want to display
detailed information about a received MDN.  This specification
defines a EmailSubmission/parseMDN method to cover this case.

1.1.  Notational conventions

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT",
"SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and
"OPTIONAL" in this document are to be interpreted as described in BCP
14 [RFC2119] [RFC8174] when, and only when, they appear in all
capitals, as shown here.

Type signatures, examples and property descriptions in this document
follow the conventions established in section 1.1 of
[I-D.ietf-jmap-core].  Data types defined in the core specification
are also used in this document.

Servers MUST support all properties specified for the new data types
defined in this document.

1.2.  Terminology

The same terminology is used in this document as in the core JMAP
specification.

1.3.  Addition to the capabilities object

The capabilities object is returned as part of the standard JMAP
Session object; see the JMAP spec.  Servers supporting _this_
specification MUST add a property called "urn:ietf:params:jmap:mdn"
to the capabilities object.

2.  MDN

An *MDN* object has the following properties:

- *forEmailId*: "String" Email Id of the received email this MDN is
  relative to.

- *subject*: "String|null" Subject used as "Subject" header for this
  MDN.

- *textBody*: "String|null" Human readable part of the MDN, as plain
  text.

- *reportingUA*: "String|null" Name of the MUA creating this MDN.
  It is used to build the MDN Report part of the MDN.
A *Disposition* object has the following properties:

- **actionMode**: "String" This MUST be one of the following strings: "manual-action" / "automatic-action"
- **sendingMode**: "String" This MUST be one of the following strings: "MDN-sent-manually" / "MDN-sent-automatically"
- **type**: "String" This MUST be one of the following strings: "deleted" / "dispatched" / "displayed" / "processed"

See [RFC8098] for the exact meaning of these different fields.

### 3. Methods added to the EmailSubmission object

#### 3.1. EmailSubmission/sendMDN

The EmailSubmission/sendMDN method generates and sends an [RFC5322] message from an MDN object.

It takes the following arguments:
o *accountId*: "Id" The id of the account to use.

o *mdns*: "String[MDN]" A map of creation id (client specified) to MDN objects

If the _forEmailId_, _subject_, _textBody_, _reportingUA_, _disposition_ properties are invalid (e.g. missing, wrong type, id not found), the submission creation is rejected with a standard "invalidProperties" SetError and no email is sent. Any other error usually sent by "EmailSubmission/set" for *create* can be returned by this method.

The client SHOULD NOT issue a sendMDN request if the message has the "$MDNSent" keyword set. In this case, the server MUST reject the submission with a standard "forbiddenToSend" SetError.

When sending the MDN, the server is in charge of generating the _originalRecipient_, _finalRecipient_ and _originalMessageID_ fields accordingly to the [RFC8098] specification.

The response has the following arguments:

o *accountId*: "String" The id of the account used for this call.

o *created*: "String[EmailSubmission]" A map of creation id (client-specified) to an email sent from the referenced properties. The returned EmailSubmission is similar to a call to a standard "EmailSubmission/set" with a _create_ parameter.

o *notCreated*: "String[SetError]" A map of creation id to a SetError object for each Email that failed to be sent. The possible errors are defined above.

For each "forEmailId" whose EmailSubmission where created, the server MUST add a "$MDNSent" keyword to the email.

3.2. EmailSubmission/parseMDN

This method allows you to parse blobs as [RFC5322] messages to get MDN objects. This can be used to parse and get detailed information about blobs referenced in the _mdnBlobIds_ of the EmailSubmission object, or any email the client could expect to be an MDN.

The _forEmailId_ property can be null or missing if the _originalMessageID_ property is missing or not referencing an existing email.

The Email/parse method takes the following arguments:
The response has the following arguments:

- *accountId*: "Id" The id of the account used for the call.
- *parsed*: "Id[MDN]|null" A map of blob id to parsed MDN representation for each successfully parsed blob, or null if none.
- *notParsable*: "Id[]|null" A list of ids given that corresponded to blobs that could not be parsed as MDNs, or null if none.
- *notFound*: "Id[]|null" A list of blob ids given that could not be found, or null if none.

4. Samples

4.1. Sending an MDN for a received email

A client can use the following request to send an MDN back to the sender:

```json
[[ "EmailSubmission/sendMDN", {
  "accountId": "ue150411c",
  "mdns": {
    "k1546": {
      "forEmailId": "Md45b47b4877521042cec0938",
      "subject": "Read receipt for: World domination",
      "textBody": "This receipt shows that the email has been displayed on your recipient’s computer. There is no guaranty it has been read or understood.",
      "reportingUA": "linagora.com; OpenPaaS",
      "disposition": {
        "actionMode": "manual-action",
        "sendingMode": "MDN-sent-manually",
        "type": "displayed"
      }
    }
  }
}, "0"]]
```

If the email id matches an existing email without the "$MDNSent" keyword, the server can answer:
4.2. Asking for MDN when sending an email

This is done with the [I-D.ietf-jmap-mail] "Email/set" _create_ method.

```json
[[ "Email/set", {
  "accountId": "ue150411c",
  "create": {
    "k1546": {
      "mailboxIds": {
        "2ea1ca41b38e": true
      },
      "keywords": {
        "$seen": true,
        "$draft": true
      },
      "from": [{
        "name": "Joe Bloggs",
        "email": "joe@example.com"
      }],
      "to": [{
        "name": "John",
        "email": "john@example.com"
      }],
      "headers": [{
        "name": "Disposition-Notification-To",
        "value": "joe@example.com"
      }],
      "subject": "World domination",
      ...
    }
  }
}, "0"]]
```

Note the specified "Disposition-Notification-To" header indicating where to send MDN back (usually the sender of the email).
4.3. Parsing a received MDN

The client issues a parse request:

```json
[
  "EmailSubmission/parseMDN",
  {
    "accountId": "ue150411c",
    "blobIds": "0f9f65ab-dc7b-4146-850f-6e4881093965"
  }, "0"
]
```

The server responds:

```json
[
  "EmailSubmission/parseMDN",
  {
    "accountId": "ue150411c",
    "parsed": {
      "0f9f65ab-dc7b-4146-850f-6e4881093965": {
        "forEmailId": "Md45b47b4877521042ec0938",
        "subject": "Read receipt for: World domination",
        "textBody": "This receipt shows that the email has been
displayed on your recipient’s computer. There is no
guaranty it has been read or understood.",
        "reportingUA": "linagora.com; OpenPaaS",
        "disposition": {
          "actionMode": "manual-action",
          "sendingMode": "MDN-sent-manually",
          "type": "displayed"
        }
      },
      "finalRecipient": "rfc822; john@example.com",
      "originalMessageID": "<1521557867.2614.0.camel@apache.org>"
    }
  }, "0"
]
```

5. IANA Considerations

5.1. JMAP Capability Registration for "mdn"

IANA will register the "mdn" JMAP Capability as follows:

Capability Name: "urn:ietf:params:jmap:mdn"

Specification document: this document

Intended use: common

Change Controller: IETF

Security and privacy considerations: this document, section 6.
5.2. Registration of JMAP keyword ‘$MDNSent’

This registers the JMAP keyword ‘$MDNSent’ in the "IMAP and JMAP keywords Registry".

Keyword name: "$MDNSent"

Scope: IMAP and JMAP

Purpose (description): Specifies that a Message Disposition Notification (MDN) must not be sent for any message annotated with the $MDNSent IMAP keyword.

Private or Shared on a server: SHARED

Is it an advisory keyword or may it cause an automatic action: This keyword can cause automatic action by the client. See [RFC3503] for more details.

When/by whom the keyword is set/cleared: This keyword is set by an IMAP client when it decides to act on an MDN request, or when uploading a sent or draft message. It can also be set by a delivery agent. Once set, the flag SHOULD NOT be cleared.

Related keywords: None

Related IMAP/JMAP Capabilities: None

Security Considerations: See Section 6 of [RFC3503]

Published specification (recommended): this document

Person & email address to contact for further information: (editor-contact-goes-here)

Intended usage: COMMON

Owner/Change controller: IESG

6. Security considerations

The same considerations regarding MDN (see [RFC8098]) apply to this document.
7. References

7.1. Normative References

Abstract

This document specifies extension to JMAP for returning S/MIME signature verification status.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on January 9, 2020.

Copyright Notice

Copyright (c) 2019 IETF Trust and the persons identified as the document authors. All rights reserved.

This document is subject to BCP 78 and the IETF Trust’s Legal Provisions Relating to IETF Documents (https://trustee.ietf.org/license-info) in effect on the date of publication of this document. Please review these documents carefully, as they describe your rights and restrictions with respect to this document. Code Components extracted from this document must include Simplified BSD License text as described in Section 4.e of the Trust Legal Provisions and are provided without warranty as described in the Simplified BSD License.
1. Introduction

[I-D.ietf-jmap-mail] is a JSON based application protocol for synchronising email data between a client and a server.

This document describes an extension to JMAP for returning S/MIME [RFC8551] signature verification status, without requiring a JMAP client to download the signature and all signed body parts or to download and decode CMS.

2. Conventions Used in This Document

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC2119].

3. Addition to the capabilities object

The capabilities object is returned as part of the standard JMAP Session object; see the JMAP spec. Servers supporting this specification MUST add a property called "urn:ietf:params:jmap:smime" to the capabilities object.

The value of this property is an empty object in both the JMAP session_capabilities_property and an account's _accountCapabilities_property.

4. Extension to Email/get for S/MIME signature verification

[I-D.ietf-jmap-mail] defines Email/get method for retrieving message specific information. This document defines the following pseudo values in the _properties_ argument:

- "smimeStatus": If "smimeStatus" is included in the list of requested properties, it MUST be interpreted by the server as a request to return "smimeStatus" property.
The "smimeStatus" response property is defined as follows:

*smimeStatus*: "String|null". null signifies that the message doesn’t contain any signature. Possible string values of the property are listed below. Servers MAY return other values not defined below. Client MUST treat unrecognized values as "unknown":

- **unknown**: S/MIME message, but it is neither signed, nor encrypted. This can also be returned for a multipart/signed message which contains unrecognized signing protocol (for example OpenPGP).

- **signed**/verified: S/MIME signed message and the sender’s signature was successfully verified, sender matches the From header field and the sender’s certificate (and the certificate chain) is trusted for signing.

- **signed**/failed: S/MIME signed message, but the signature failed to verify. This might be a policy related decision (message signer doesn’t match the From header field), message was modified, the signer’s certificate has expired or was revoked, etc.
This will result in the following response:

```
["Email/get", {
    "accountId": "abc",
    "state": "41234123231",
    "list": [
        {
            "id": "f123u457",
            "mailboxIds": { "f123": true },

```

Example

5. Open Issues

   [[This section should be empty before publication]]

6. IANA Considerations

6.1. JMAP capability registration for "smime"

IANA is requested to register the "smime" JMAP Capability as follows:

   Capability Name: "urn:ietf:params:jmap:smime"

   Specification document: this document

   Intended use: common

   Change Controller: IETF

   Security and privacy considerations: this document, Section 7
7. Security Considerations

Server side S/MIME signature verification requires the client to trust server verification code and configuration to perform S/MIME signature verification. For example, if the server is not configured with some Trust Anchors, some messages will have "signed/failed" status instead of "signed/verified".

TBD.

A JSON Meta Application Protocol (JMAP) Subprotocol for WebSocket

draft-ietf-jmap-websocket-02

Abstract

This document defines a binding for the JSON Meta Application Protocol (JMAP) over a WebSocket transport layer. The WebSocket binding for JMAP provides higher performance than the current HTTP binding for JMAP.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on January 6, 2020.

Code Components extracted from this document must include Simplified BSD License text as described in Section 4.e of the Trust Legal Provisions and are provided without warranty as described in the Simplified BSD License.
1. Introduction

JMAP [I-D.ietf-jmap-core] over HTTP [RFC7235] requires that every JMAP API request be authenticated. Depending on the type of authentication used by the JMAP client and the configuration of the JMAP server, authentication could be an expensive operation both in time and resources. In such circumstances, authenticating every JMAP API request may harm performance.

The WebSocket binding for JMAP eliminates this performance hit by authenticating just the WebSocket handshake request and having those credentials remain in effect for the duration of the WebSocket connection. This binding supports JMAP API requests and responses, with optional support for push notifications.

Furthermore, the WebSocket binding for JMAP can optionally compress [RFC7692] both JMAP API requests and responses. Although compression of HTTP responses is ubiquitous, compression of HTTP requests has very low, if any deployment, and therefore isn’t a viable option for JMAP API requests over HTTP.
2. Conventions Used in This Document

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [1] [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

The same terminology is used in this document as in the core JMAP specification.

3. Discovering Support for JMAP over WebSocket

The JMAP capabilities object is returned as part of the standard JMAP Session object (see Section 2 of [I-D.ietf-jmap-core]). Servers supporting this specification MUST add a property named "urn:ietf:params:jmap:websocket" to the capabilities object. The value of this property is an object which MUST contain the following information on server capabilities:

- `webSocketUrl`: "String" The URL to use for initiating a JMAP over WebSocket handshake.
- `supportsWebSocketPush`: "Boolean" This is "true" if the server supports push notifications over the WebSocket, as described in Section 4.2.4.

Example:

```
"urn:ietf:params:jmap:websocket": {
   "webSocketUrl": "/jmap/ws/",
   "supportsWebSocketPush": true
}
```

4. JMAP Subprotocol

The term WebSocket subprotocol refers to an application-level protocol layered on top of a WebSocket connection. This document specifies the WebSocket JMAP subprotocol for carrying JMAP API requests, responses, and optional push notifications through a WebSocket connection. Binary data MUST NOT be uploaded or downloaded through a WebSocket JMAP connection. Binary data is handled per Section 6 of [I-D.ietf-jmap-core]) via a separate HTTP connection or stream.
4.1. Handshake

The JMAP WebSocket client and JMAP WebSocket server negotiate the use of the WebSocket JMAP subprotocol during the WebSocket handshake, either via a HTTP/1.1 Upgrade request (see Section 1.3 of [RFC6455]) or a HTTP/2 Extended CONNECT request (see Section 5 of [RFC8441]). Regardless of the method used for the WebSocket handshake, the client MUST make an authenticated [RFC7235] HTTP request on the JMAP "webSocketUrl" (Section 3), and the client MUST include the value 'jmap' in the list of protocols for the 'Sec-WebSocket-Protocol' header field. The reply from the server MUST also contain 'jmap' in its corresponding 'Sec-WebSocket-Protocol' header field in order for a JMAP subprotocol connection to be established.

If a client receives a handshake response that does not include 'jmap' in the 'Sec-WebSocket-Protocol' header, then a JMAP subprotocol WebSocket connection was not established and the client MUST close the WebSocket connection.

Once the handshake has successfully completed, the WebSocket connection is established and can be used for JMAP API requests, responses, and optional push notifications. Other message types MUST NOT be transmitted over this connection.

The credentials used for authenticating the HTTP request to initiate the handshake remain in effect for the duration of the WebSocket connection.

4.2. WebSocket Messages

Data frame messages in the JMAP subprotocol MUST be of the text type and contain UTF-8 encoded data. The messages MUST be in the form of a single JMAP Request object (see Section 3.2 of [I-D.ietf-jmap-core]) or JMAP WebSocketPushEnable object (see Section 4.2.4) when sent from the client to the server, and in the form of a single JMAP Response object, JSON Problem Details object, or JMAP StateChange object (see Sections 3.3, 3.5.1, and 7.1 respectively of [I-D.ietf-jmap-core]) when sent from the server to the client.

4.2.1. JMAP Requests

This specification adds two extra arguments to the Request object:

@type: "String" This MUST be the string "Request".
id: "String" (default: ) A client-specified identifier for the request.

JMAP over WebSocket allows the server to process requests out of order. The client-specified identifier is used as a mechanism for the client to correlate requests and responses.

Additionally, the "maxConcurrentRequests" field in the "capabilities" object (see Section 2 of [I-D.ietf-jmap-core]) limits the number of inflight requests over the WebSocket.

4.2.2. JMAP Responses

This specification adds two extra arguments to the Response object:

@type: "String" This MUST be the string "Response".

requestId: "String|null" The client-specified identifier in the corresponding request. If "null", no identifier was provided in the request.

4.2.3. JMAP Request-level Errors

This specification adds two extra arguments to the Problem Details object:

@type: "String" This MUST be the string "RequestError".

requestId: "String|null" The client-specified identifier in the corresponding request. If "null", no identifier was provided in the request.

4.2.4. JMAP Push Notifications

JMAP over WebSocket servers that support push notifications on the WebSocket will advertise a "supportsWebSocketPush" property with a value of "true" in the server capabilities object.

A client enables push notifications from the server by sending a WebSocketPushEnable object to the server. A WebSocketPushEnable object has the following properties:

@type: "String" This MUST be the string "WebSocketPushEnable".

dataTypes: "String[]|null" A list of data type names (e.g. "Mailbox", "Email") that the client is interested in. A StateChange notification will only be sent if the data for one of these types changes. Other types are omitted from the TypeState
object. If "null", changes will be pushed for all supported data
types.

pushState: "String" Optional. The last "pushState" token that the
client received from the server. Upon receipt of a "pushState"
token, the server SHOULD immediately send all changes since that
state token.

All push notifications take the form of a standard StateChange object
(see Section 7.1 of [I-D.ietf-jmap-core]).

This specification adds one extra argument to the StateChange object:

pushState: "String" Optional. A (preferably short) string
representing the state on the server for ALL of the data types in
the account (not just the objects returned in this call).

4.3. Examples

The following examples show WebSocket JMAP opening handshakes, a JMAP
Core/echo request and response, and a subsequent closing handshake.
The examples assume that the JMAP "webSocketUrl" has been advertised
in the JMAP Session object as "/jmap/ws/". Note that folding of
header fields is for editorial purposes only.

WebSocket JMAP connection via HTTP/1.1 with push notifications
enabled:

[[ From Client ]]                  [[ From Server ]]  
GET /jmap/ws/ HTTP/1.1
Host: server.example.com
Upgrade: websocket
Connection: Upgrade
Authorization: Basic Zm9vOmJhcg==
Sec-WebSocket-Key: dGhlIHNhbXBsZSBub25jZQ==
Sec-WebSocket-Protocol: jmap
Sec-WebSocket-Version: 13
Origin: http://www.example.com

HTTP/1.1 101 Switching Protocols
Upgrade: websocket
Connection: Upgrade
Sec-WebSocket-Accept: s3pPLMBiItxa9kY6zrZBbK+x0c=
Sec-WebSocket-Protocol: jmap
[WebSocket connection established]

[HTTP/2 stream closed]
5. Security Considerations

The security considerations for both WebSocket (see Section 10 of [RFC6455]) and JMAP (see Section 8 of [I-D.ietf-jmap-core]) apply to the WebSocket JMAP subprotocol.

6. IANA Considerations

6.1. Registration of the WebSocket JMAP Subprotocol

This specification requests IANA to register the WebSocket JMAP subprotocol under the "WebSocket Subprotocol Name" Registry with the following data:

Subprotocol Identifier: JMAP
Subprotocol Common Name: WebSocket Transport for JMAP (JSON Meta Application Protocol)
Subprotocol Definition: RFCXXXX (this document)

7. Acknowledgments

The author would like to thank the following individuals for contributing their ideas and support for writing this specification: Neil Jenkins, Robert Mueller, and Chris Newman.

Appendix A. Change History (To be removed by RFC Editor before publication)

Changes since ietf-01:
  o Changed 'wsURL' to 'webSocketUrl' and removed push query option.
  o Added 'supportsWebSocketPush' capability.
  o Added '@type' argument to Request object.
  o Added 'WebSocketPushEnable' object.
  o Added 'pushState' argument to StateChange object.
  o Updated example.
  o Minor Editorial changes.

Changes since ietf-00:
Added text describing advertisement of and selection of optional push notifications.

Minor Editorial changes.

Changes since murchison-02:

Renamed as a JMAP WG document.

Allow out of order processing.

Allow push notifications.

Modified examples.

Add Security Considerations text.

Minor Editorial changes.

Changes since murchison-01:

Updated WebSocket over HTTP/2 reference to RFC8144.

Changes since murchison-00:

Fleshed out section on discovery of support for JMAP over WebSocket.

Allow JSON Problem Details objects to be returned by the server for toplevel errors.

Mentioned the ability to compress JMAP API requests.

Minor Editorial changes.
