Montreal

# 0-RTT Converter PoC over Real 5G

KT and Tessares joint work based on draft-ietf-tcpm-converters

SungHoon Seo, H. Yu, J. Choi {sh.seo, hyun.yu, choi.jinho}@kt.com

M. Baerts, G. Detal, O. Bonaventure {matthieu.baerts, gregory.detal, olivier.Bonaventure}@tessares.net

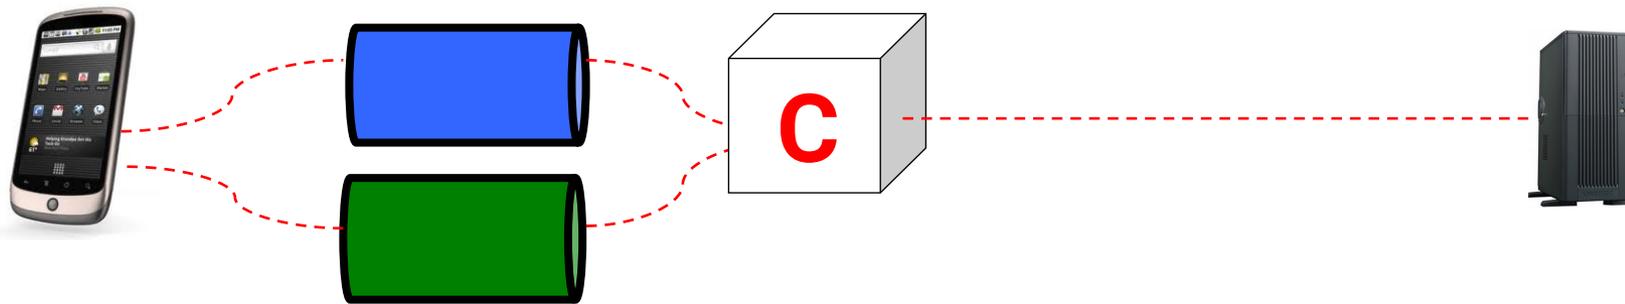

# 1 The 0-RTT TCP Convert Protocol

<https://tools.ietf.org/html/draft-ietf-tcpm-converters>

## Initial Motivation

- More Multipath TCP enabled clients than Multipath TCP enabled servers
- Clients want to benefit from MPTCP at least on a fraction of the end-to-end path

## IETF Discussion

- Not ready for a MPTCP approach, but a generic one could be acceptable

## 2 The Basic Design

<https://tools.ietf.org/html/draft-ietf-tcpm-converters>

0-RTT Convert Protocol is an **application-level protocol** listening on a specific TCP port

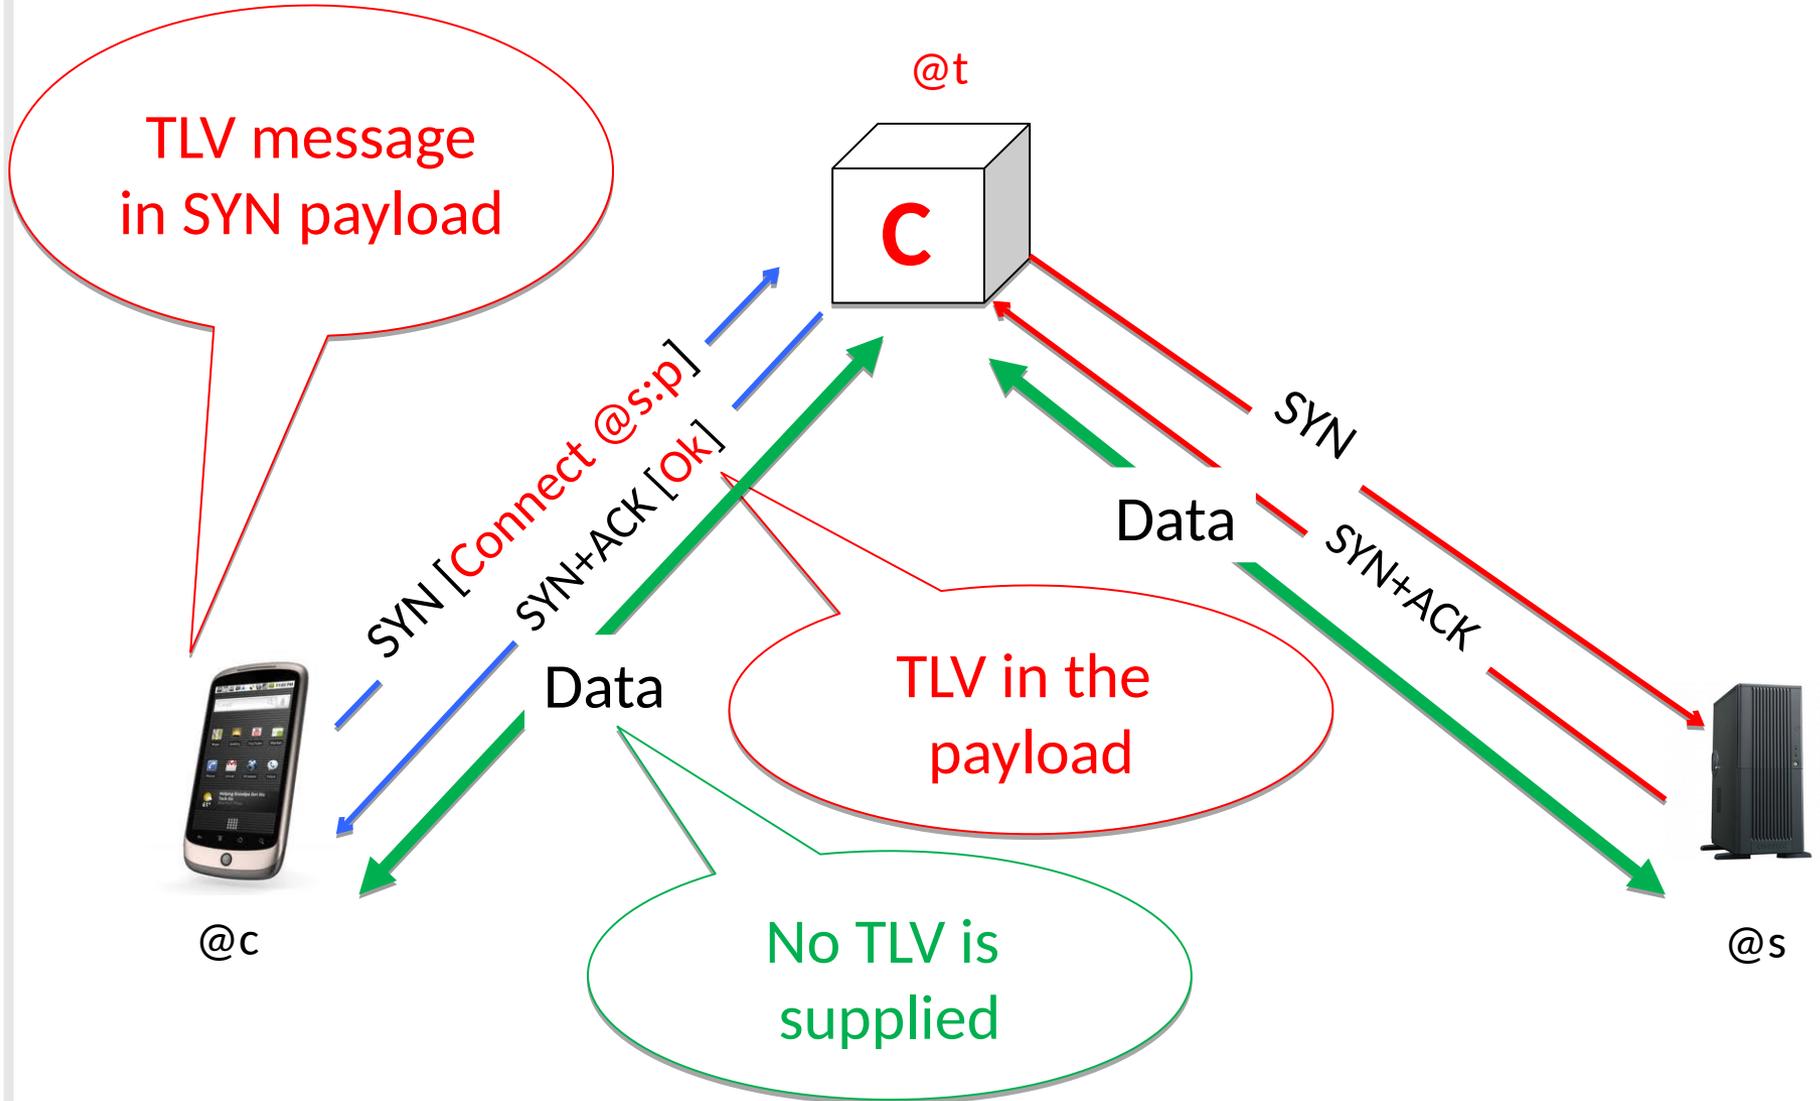

- Commands and responses are encoded as **TLVs**
  - ✓ Ensures extensibility
- Commands are sent inside SYN
  - ✓ Provides **0-RTT** to minimize connection establishment delays
- Responses are returned in SYN+ACK
- A **plain transport mode** is used between Clients and Converters (no encapsulation)

Clients can learn TCP options supported by Servers

- Allows Clients to **bypass** the Converter

### 3 Simple Example

How 0-RTT Convert protocol works?

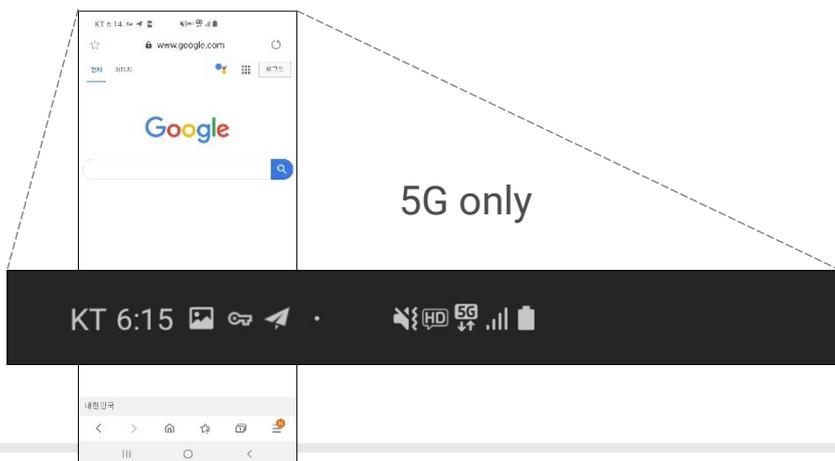

# 4 Proof of Concept

KT-Tessares joint collaboration for implementation and engineering based on the draft

## Client side

- Open-source client library and wireshark dissectors released by Tessares
  - ✓ <https://www.tessares.net/technology/open-source-contributions/>
- Compare 0-RTT convert and SOCKSv5 protocol capable android smartphones
  - ✓ PoC Clients : Samsung Galaxy S10 5G (SM-G977N) in ENG firmware

0-RTT Convert	SOCKSv5
an open-source SOCKS integration	redsocks
5G only, 5G+WiFi with MPTCP	5G only, 5G+WiFi with MPTCP

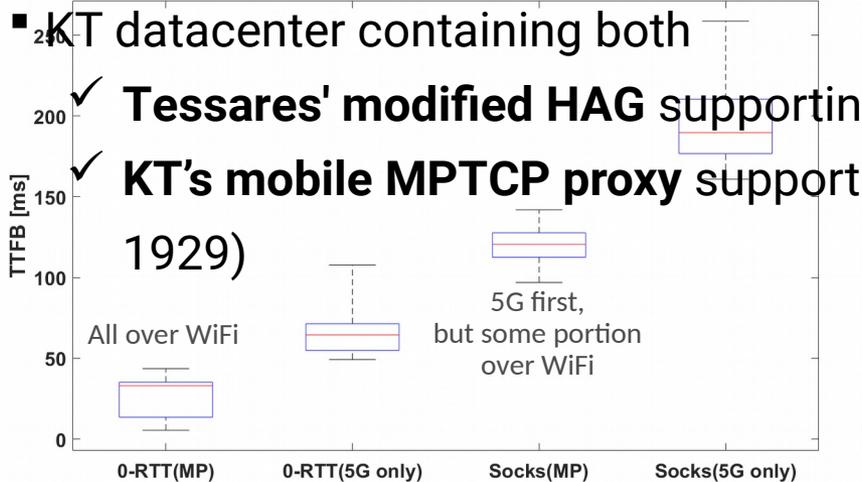

# 5 Measurement Results

Comparison with conventional proxy way

## Test Scenario and Initial Results

- Commercial 5G network (NSA, 3.5GHz NR, CUPS 5GC, IPv6) + IEEE 802.11ax WiFi
- Compare latency for setup connection for 0-RTT Convert and SOCKSv5 protocol
  - ✓ TTFB : Time to First Byte; From time of SYN sent, to connection acceptance

msec	0-RTT Convert		SOCKSv5	
	MP* (WiFi+5G)	5G only	MP** (5G+WiFi)	5G only
MEAN	27.8	64.7	120.5	195.9
MIN	5.4	49.2	97.9	160.9
MAX	43.6	107.7	142.9	258.8

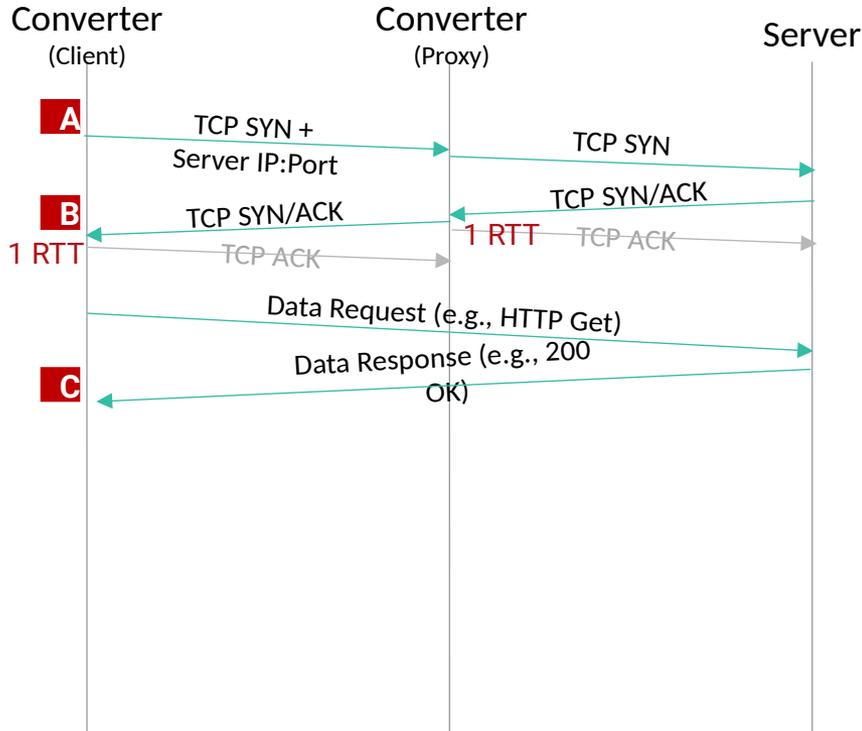

\* Primary route is WiFi

\*\* Primary route is 5G

# A End-to-End Signalings

0-RTT Convert vs. SOCKSv5 w/ authentication

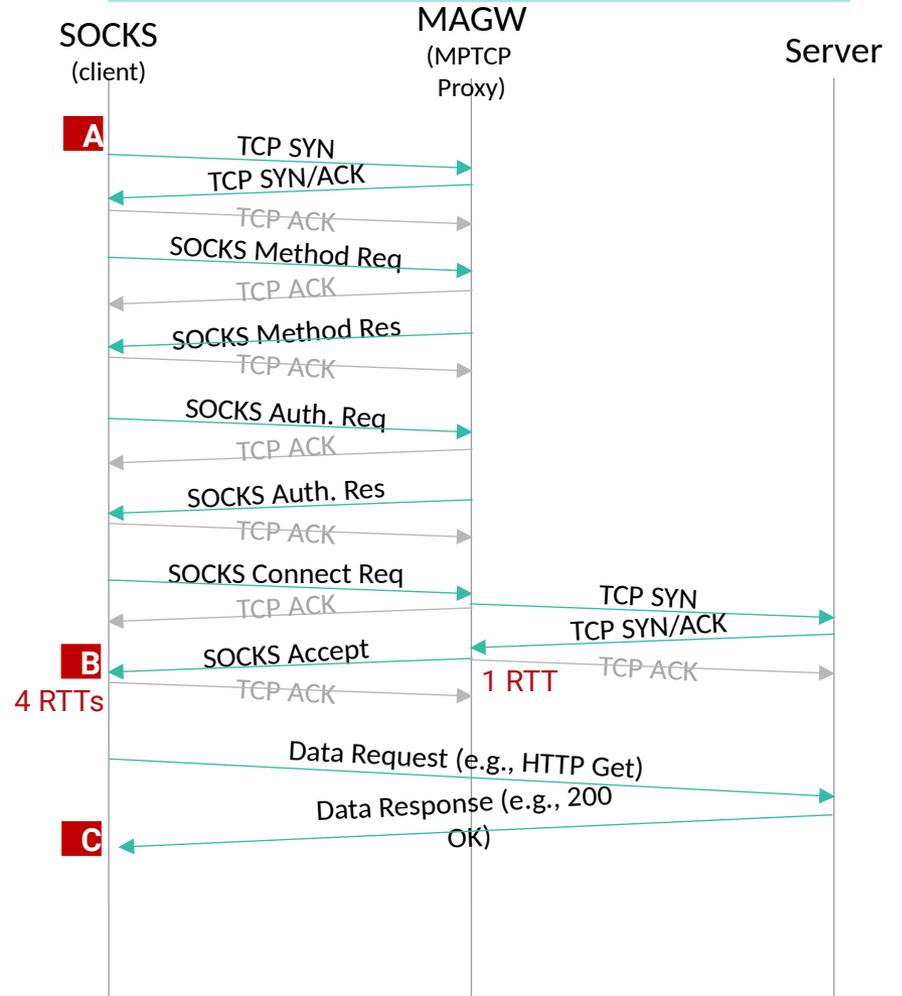

## 0-RTT Convert (1RTT+1RTT)

▪  $TTFB = B - A$  // Time To First Byte

▪  $TTGTFB = C - A$  // Time To Get the First Byte

## SOCKS (4RTTs+1RTT)

# Q & A
